ERP HERITAGE

The accounting operating handbook

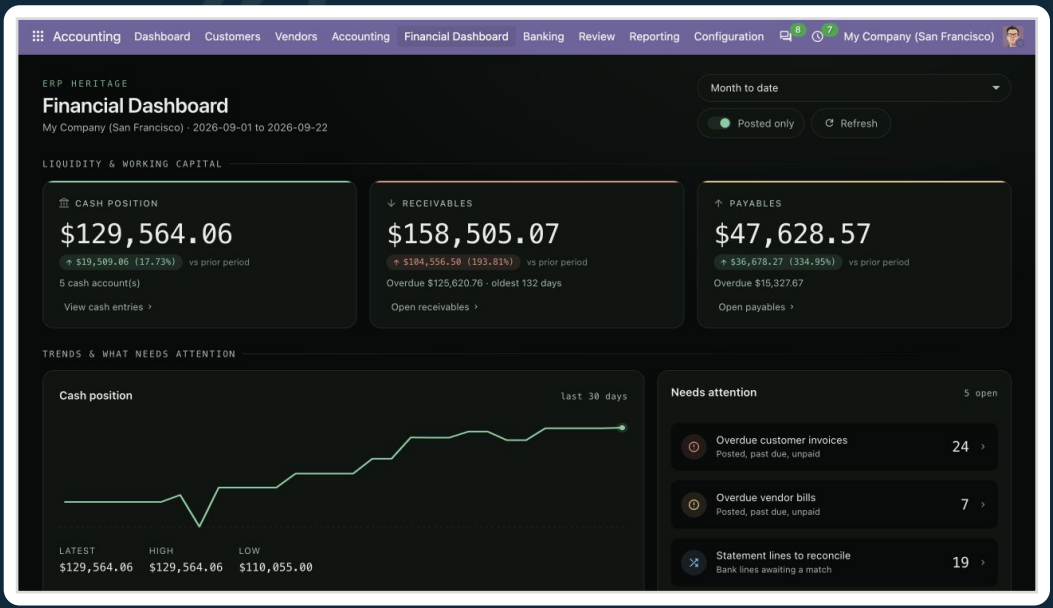

Odoo 20 Community Accounting Pro

A practical route from daily transactions to specialist accounting, financial statements and a reviewed close.

50
direct accounting dependencies

52
modules in the global closure

53
quickstarts, including optional BAS

Real product screen. Synthetic demonstration records.

Global suite. Australian BAS selected separately.

September 2026 edition / ERP Heritage

ORIENTATION

Find the work you need

Start with pages 3-10 for navigation and operating context. Each module quickstart then states its role, first actions, review exercise and scope boundary.

Global installation: 50 direct accounting dependencies plus EH EDI Core and the suite itself. Australian BAS is optional, depends on the suite, and appears separately on page 63.

3 Menu map 4 Rollout 5-10 Workflow families 64 Parent accounts 65 Bank-feed review 66 Close readiness

NAVIGATION

One Accounting app. Work by task.

The suite reorganises existing actions around finance work. Menu visibility still follows each user's roles and allowed companies.

Customers

Invoices, payments, collections, recurring invoices and received cheques.

Vendors

Bills, payments, bill intake, Peppol inbound documents and issued cheques.

Accounting

Setup Guide; Transactions; Assets and Leases; Planning and Costing; Closing; IFRS Standards.

Banking

Bank Statements, import evidence and duplicates; Bank Reconciliation; Payments; Cheques.

Review

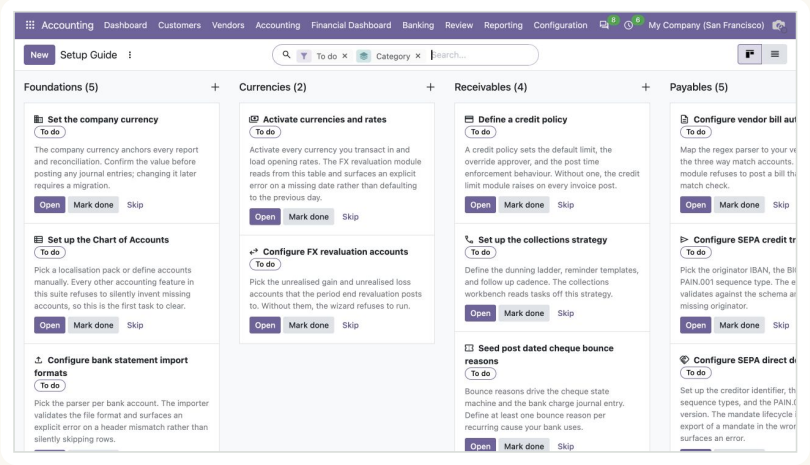

Approval and anomaly control work; Audit Pack; Audit Logs.

Reporting

Statements, partner reports, taxes, management analysis, ledgers, consolidation, disclosures and custom reports.

Configuration

Accounting policies and the existing report, workflow, asset, banking, payment and localisation settings.

Company setup guide groups finance tasks by area, with links and completion or skip controls. Captured 2026-09-22 from isolated Odoo 20 Community database with synthetic demonstration records. No external submission or live banking activity is represented.

ROLLOUT

Make the first live process deliberate

Use representative records, the intended users and an owned review decision. Installing an app does not complete the accounting configuration.

01 / Confirm the footprint

Review the global dependency set and existing accounting addons. Sales, Purchase and Inventory arrive through the suite's dependency chain. Australian BAS is selected separately; its installation brings the suite as a foundation.

02 / Establish company and accounting context

Confirm companies, currencies, fiscal dates, chart, tax mapping and opening balances. Decide which specialist engines apply to the business and identify who owns their policy and source evidence.

03 / Assign users and review responsibility

Separate operator work, manager decisions and read-only review. Check the actual users' access to relevant records and companies. A visible menu does not grant posting rights or prove access to every underlying model.

04 / Accept one complete workflow

Prepare a representative transaction, inspect the supported calculation or control, follow any approval and trace the result to its ledger and report. Add one relevant exception, such as a missing rate, invalid bank detail or changed document.

05 / Arrange optional external services

File parsers and deterministic helpers are included in their documented scope. Live bank-provider adapters, OCR providers, Peppol access-point transport and optional language-model providers require their separate integrations and operational arrangements.

06 / Prepare the deployment handover

Record settings, data ownership, known limits and the accepted operating example. The EDI vault requires cryptography and configured key management. EH EDI Core creates one idempotent ERP Heritage support contact. Preserve the database backup and the relevant key-recovery plan.

07 / Review locking before sign-off

Close and audit workflows can change accounting locks. Have the accountable manager review the actual scope, ended period and correction policy before advancing fiscal or hard lock dates.

WORKFLOW FAMILIES

01-02 / Connected finance work

Use the family view to understand process handoffs. Use the individual quickstart for the specific module's inputs and limits.

Financial reports and the daily overview

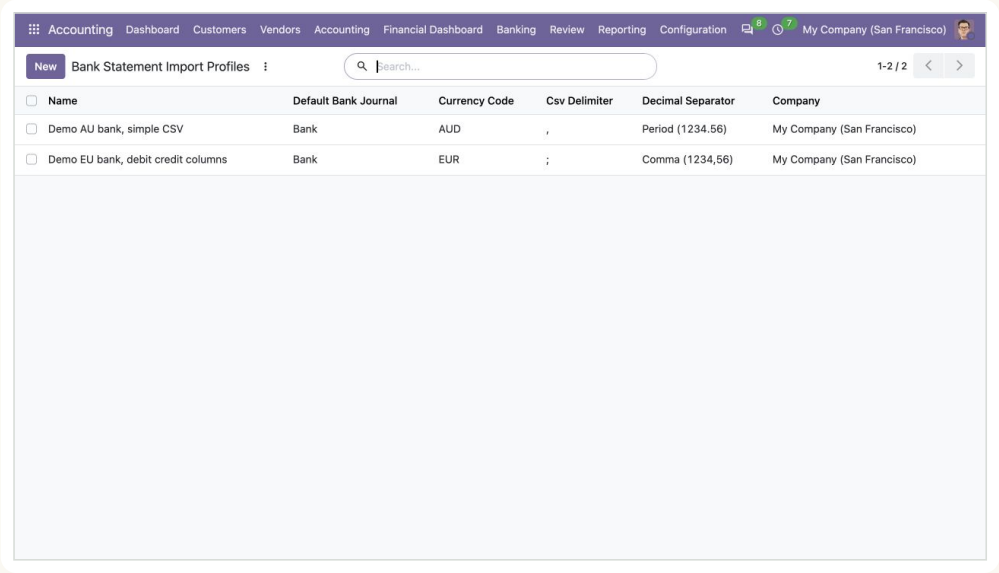

Open the day with cash, receivables, payables and items needing attention. Review Profit and Loss, Balance Sheet, Trial Balance, ledgers, aging and cash flow with drill-down and exports. Build report definitions and saved views for recurring management questions, then schedule delivery where appropriate. The shared report-execution history records the options and output evidence behind a run, giving reviewers a starting point when a figure is challenged.

Accounting Suite Base p12 | Accounting Setup Guide p13 | Financial Dashboard p16 | Dynamic Account Reports p14 | Dynamic Reports Pro p15

Banking and payment preparation

Bring CSV, OFX, QIF, CAMT.053 or MT940 statements into a consistent import process. Check duplicates, review matching suggestions and retain reconciliation decisions. Prepare inbound or outbound payment batches and the supported SEPA files, with mandates for direct debit. File generation, bank acceptance and actual settlement are separate events: your team can see which stage it is reviewing. Live bank feeds use separately installed connector packages.

Bank Reconciliation Pro p17 | Bank Statement Import p18 | Batch Payment p19 | SEPA Credit Transfer p35 | SEPA Direct Debit p36

Reusable file-import profiles keep bank journal, currency, CSV delimiter and decimal conventions together. Captured 2026-09-22 from an isolated Odoo 20 Community database with synthetic demonstration profiles. No bank connection or live banking activity is represented.

WORKFLOW FAMILIES

03-04 / Connected finance work

Use the family view to understand process handoffs. Use the individual quickstart for the specific module's inputs and limits.

Customer balances and collections

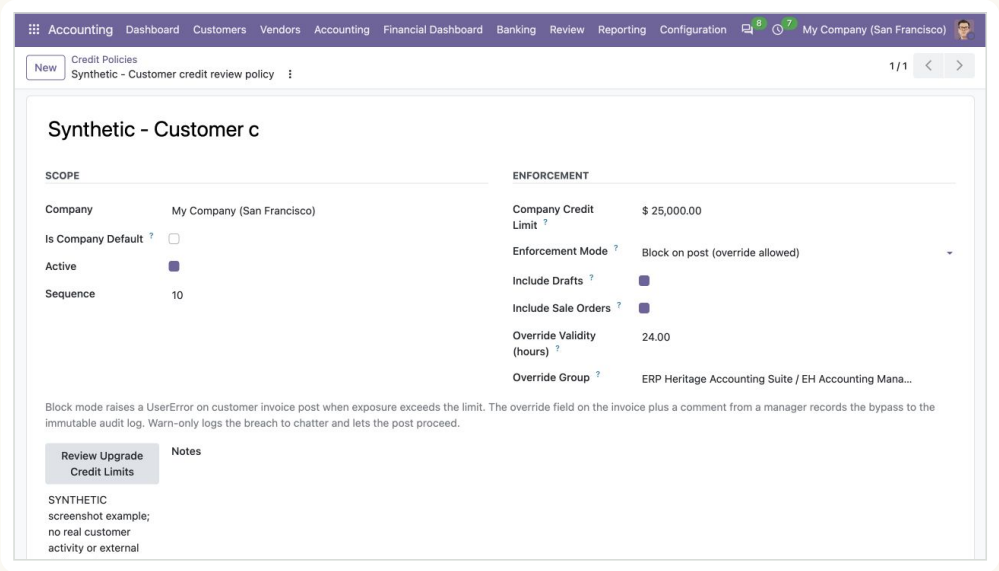

Give overdue invoices an owner and a next action. Track collection cases, follow-up stages and promises to pay; apply credit policy before more exposure is accepted. Manage recurring invoice schedules and post-dated cheques alongside ordinary receivables. Customer portal statements help customers understand their open balance. Deterministic collections assistance supports the next-action decision while your team remains responsible for the contact and commercial judgment.

Collections Workbench p20 | Customer Credit Limit p21 | Recurring Invoices Pro p22 | Post Dated Cheques (PDC) p23 | Customer Portal Extra p24 | AI Collections Advisor p39

Vendor intake and approval

Capture incoming bills, review extracted values and compare the document against purchasing and receipt evidence. Route bills and journal entries through approval policies that reflect the amount and responsible groups. Keep tolerance decisions and approval history beside the transaction instead of in a separate email chain. Deterministic extraction is included; live document OCR requires an optional provider extension and its configuration.

Vendor Bill Automation p25 | Approval Workflow p26

Synthetic credit policy uses the native company credit limit, includes configured exposure sources and requires managed overrides. Captured 2026-09-22 from isolated Odoo 20 Community database with synthetic demonstration records. No external submission or live banking activity is represented.

WORKFLOW FAMILIES

05-06 / Connected finance work

Use the family view to understand process handoffs. Use the individual quickstart for the specific module's inputs and limits.

Assets, leases and capital projects

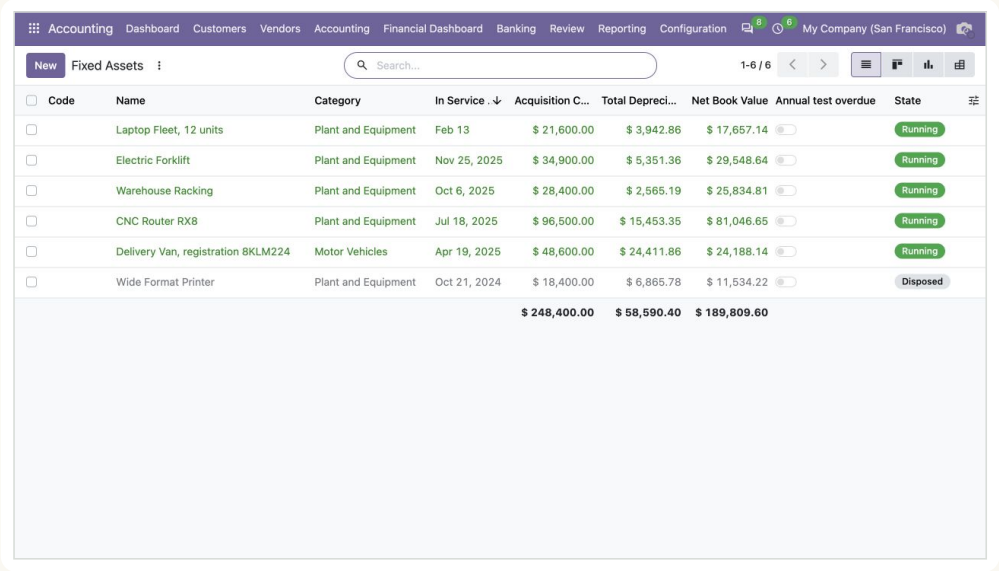

Maintain fixed-asset records and depreciation schedules, then handle changes such as revaluation, impairment or disposal in their proper workflow. Lease records bring right-of-use assets and lease liabilities into the same finance environment. Separate workspaces cover borrowing costs, investment property and held-for-sale classifications. These modules support the accounting life of an asset; the team still reviews assumptions, dates, useful lives and account mappings before posting.

Fixed Assets and Leases p27 | Borrowing Costs (IAS 23) p46 | Investment Property p49 | IFRS 5 Held for Sale p50

Contract revenue and recurring billing

Keep billing schedules and revenue recognition understandable when they follow different timelines. Record transaction price and performance obligations, review progress and variable consideration, and handle contract changes through the revenue workflow. The recurring-invoice bridge connects repeat billing to the contract process. This gives service and subscription teams a place to explain why this period's recognized revenue differs from this period's invoices.

IFRS 15 Revenue p44 | Revenue Recurring Bridge p45

Asset register with running and disposed assets, accumulated depreciation and net book values. Captured 2026-09-22 from isolated Odoo 20 Community database with synthetic demonstration records. No external submission or live banking activity is represented.

WORKFLOW FAMILIES

07-08 / Connected finance work

Use the family view to understand process handoffs. Use the individual quickstart for the specific module's inputs and limits.

Budgets, costs and inventory estimates

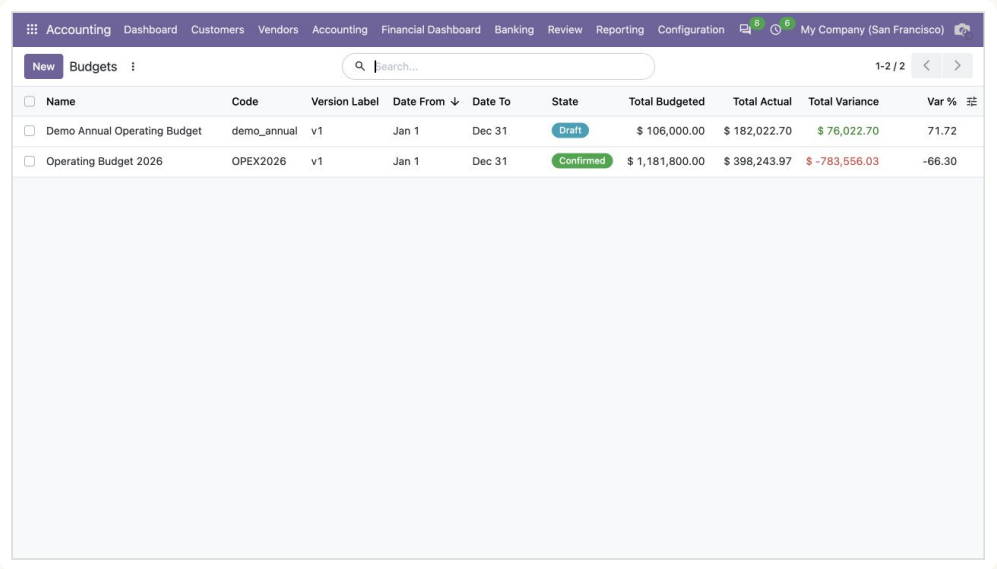

Keep budget versions identifiable and compare the chosen plan with actual results. Bring budget comparisons into financial reporting, use costing records for cost cards and variance work, and review inventory net realizable value where carrying amounts need attention. Deterministic variance commentary supplies a starting explanation. Reviewers can check the affected lines and assumptions before deciding whether the response is operational, commercial or accounting.

Multi Version Budget Pro p33 | Reports: Budget Columns p60 | Standard Costing & CVP p57 | IAS 2 Inventory NRV p48 | AI Budget Commentary p38

Group accounting and intercompany work

Coordinate transactions between related companies, including invoice and bill mirrors and the sales-to-purchase bridge. Prepare consolidation runs with currency translation, intercompany elimination and non-controlling-interest treatment. Business-combination records add acquisition accounting to the group workflow. Review each company's source data and mapping before relying on group output: the benefit is a connected process with identifiable adjustments, not a hidden consolidation spreadsheet.

Inter-Company Rules p31 | Intercompany SO/PO p52 | Group Consolidation p32 | IFRS 3 & IAS 28 p51

Compare a draft budget and a confirmed operating budget with planned amounts, actuals and variances. Captured 2026-09-22 from isolated Odoo 20 Community database with synthetic demonstration records. No external submission or live banking activity is represented.

WORKFLOW FAMILIES

09-10 / Connected finance work

Use the family view to understand process handoffs. Use the individual quickstart for the specific module's inputs and limits.

Risk, tax and obligations

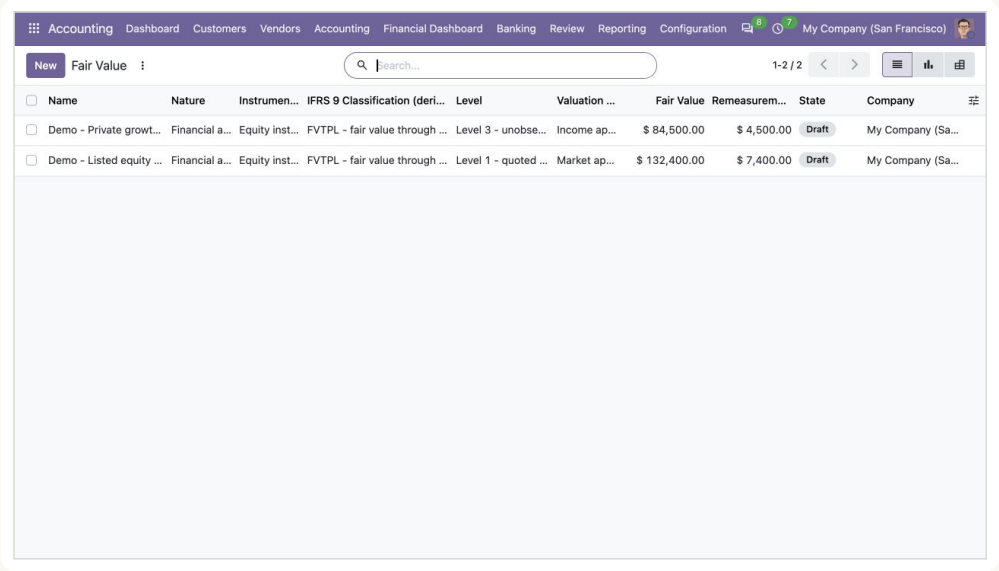

Give accounting estimates their own records, assumptions and review path. The included engines address expected credit losses, fair value, deferred tax, provisions and government grants. Work through a calculation before posting its movement and keep the supporting inputs available for the next period. The suite organizes these technical subjects; it does not replace an accountant's judgment about the applicable policy or the evidence supporting an estimate.

IFRS 9 Expected Loss p40 | IFRS 13 Fair Value p41 | Deferred Tax (IAS 12) p42 | IAS 37 Provisions p43 | IAS 20 Government Grants p47

Employee benefits and equity accounting

Prepare employee-benefit and share-based-payment accounting alongside the ledger rather than keeping the entire process outside the system. Review plan information, valuations and period movements, then use earnings-per-share records where the reporting entity needs them. These are specialist accounting workspaces, with assumptions and review responsibilities that differ from payroll processing or maintaining a shareholder register.

IAS 19 Benefits p56 | IFRS 2 Share-based Pay p55 | EPS (IAS 33) p54

Compare draft Level 1 and Level 3 investments, valuation techniques and proposed remeasurement amounts. Captured 2026-09-22 from isolated Odoo 20 Community database with synthetic demonstration records. No external submission or live banking activity is represented.

WORKFLOW FAMILIES

11-12 / Connected finance work

Use the family view to understand process handoffs. Use the individual quickstart for the specific module's inputs and limits.

Period close and audit evidence

Turn the month-end checklist into assigned work with status and sign-off. Review open issues, calculate period-end currency adjustments, prepare year-end closing and collect the checks needed for an audit pack. Stored anomaly findings give the team another review queue. Deterministic checks work without an external AI key; optional provider extensions can add language-model assistance when the organization chooses to configure one.

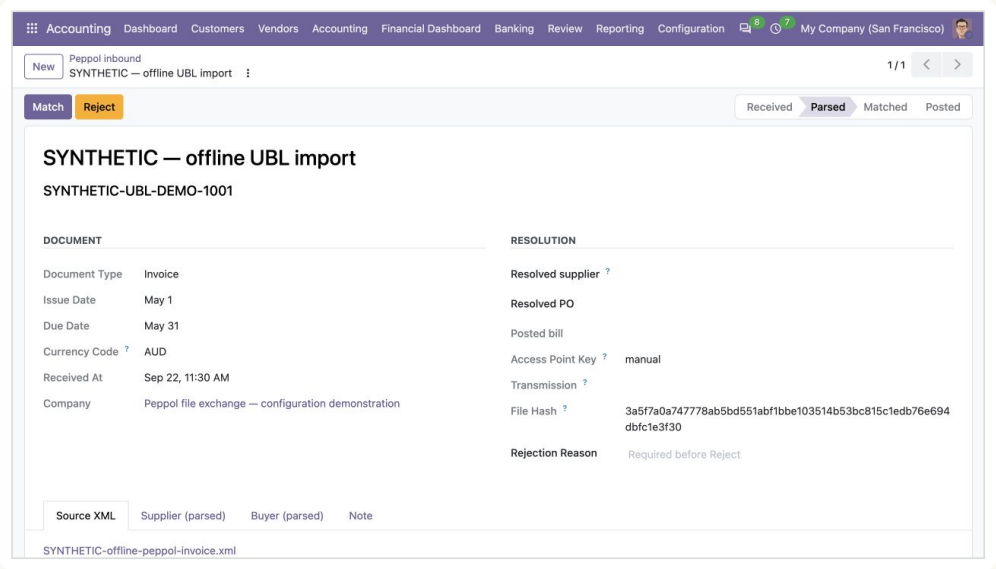

Period Close Workflow p28 | Year-End Closing p29 | FX Period End Revaluation p30 | Audit Pack & Integrity p61 | AI Agent Layer p37

Statements, disclosures and document exchange

Prepare comprehensive income, changes in equity and structured disclosure work alongside the underlying accounting modules. Review subsequent events and accounting changes, with Australian BAS available through a separate optional app that installs the suite. Peppol document generation and inbound parsing support electronic invoice workflows; a live access-point transport is a separate requirement. Standards references describe the module's subject matter, not regulatory certification or acceptance by every filing authority.

IAS 1 Primary Statements p58 | IFRS Disclosure Notes p59 | IAS 8 & 10 Events p53 | Peppol eInvoicing p34

Optional country app: Australian BAS is outside the global suite installation. Selecting BAS installs the suite and adds the Australian workflow. See page 63.

Parsed offline UBL invoice retains its synthetic source file, invoice reference, dates and currency; it has not been matched or posted. Captured 2026-09-22 from isolated Odoo 20 Community after parsing the project's synthetic UBL fixture through the actual manual-file inbound workflow. No Peppol network receipt, access-point request, transmission or certification is represented.

ACCOUNTING WORKSPACE

Odoo 20 Community Accounting Pro

ERP Heritage Community Accounting Pro installs a fixed collection of 50 direct accounting dependencies. Together with the suite itself and the transitive EH EDI Core foundation, its custom-module closure contains 52 modules.

20.0.2.1.4 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Map the finance team to daily accounting, control, reporting and specialist work before enabling workflows for each company.

2. Install the fixed bundle, then use its company-aware setup tasks to assign the configuration that each operation needs.

3. Walk one representative transaction through entry, approval, payment, reporting and close so the team can check ownership at every handoff.

4. Document the applications and external services needed for the chosen deployment; an installed module is only one part of operational readiness.

A useful acceptance exercise

A group is moving two companies onto Community accounting. Both need reporting and payments, but only the Australian entity needs BAS preparation and only one entity has leases. Install the global bundle, then choose the separate BAS app only when that Australian reporting process is wanted. Begin with a common transaction and reporting pilot, then assign the applicable specialist setup work. Review the distinction between an installed capability and an approved operational process. Have accounts payable enter and review a bill, treasury prepare its payment, and the controller trace the result to the chosen financial report. Separately inspect a lease and, if the optional BAS app has been installed, its preparation case with the specialist owner. The acceptance decision should record which functions are ready, which remain out of scope and which need separate bank, OCR, access-point or optional AI integrations.

Inspect these capabilities

Daily accounting with a shared work structure. Connect the routines that create and settle balances: incoming bills, recurring invoices, bank imports, reconciliation, payment batches and collection cases. Each process retains its own evidence and supported controls.

Reports that lead back to their scope. Combine standard financial reports, custom definitions, saved reporting choices and a company-focused dashboard. Reviewers can move from an amount to the applicable detail and retain the reporting context.

Specialist accounting as explicit registers. Use purpose-built records for applicable asset, lease, revenue, impairment, fair-value, deferred-tax, provision and other supported accounting subjects. Separate inputs, period movements and review states help teams explain their treatment.

Know the scope boundary

The global suite has 50 direct custom accounting dependencies and one additional transitive custom dependency, EH EDI Core. Including the suite itself, the custom-module closure is 52 modules.

Live bank-provider adapters, live OCR providers, live Peppol AS4 access-point transport and optional language-model providers require their separate integrations. A shipped parser, adapter registry or deterministic helper should not be presented as an active connection to those services.

Installation foundation

50 direct accounting dependencies plus the transitive EH EDI Core foundation. Australian BAS is not installed by the global suite.

FOUNDATION

Accounting Suite Base

The shared engine that powers the ERP Heritage accounting modules for Odoo 20 Community. It auto-installs as a dependency of any ERP Heritage accounting module, so you do not need to install it by hand.

20.0.1.8.3 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Establish who prepares, manages and reviews reports and confirm the companies each role may access.

2. Run a report through a consuming accounting module and retain its options together with the execution record.

3. Compare a repeat run with the same scope and then a run after an intentional source change, checking that the recorded provenance remains understandable.

4. Use the shared engine as infrastructure for the suite; select a reporting module for the accountant-facing report library.

A useful acceptance exercise

A reviewer receives two balance-sheet exports with the same dates and asks whether they were produced from the same accounting context. Open their execution evidence and compare the company scope and options, rather than assuming that matching file names prove equivalence. A changed ledger or report-visible configuration can make a later result legitimately different. In a test database, run the report twice without changing its inputs, then make a controlled relevant change and run it again. Inspect how the source execution and refreshed computation can be explained. Keep this exercise focused on reproducibility: caching improves reuse of the applicable computation, while the audit record explains how the report was requested.

Inspect these capabilities

Every render is on the record. Each report run writes an append-only execution row: the user, the timestamp, the full options snapshot, the runtime, and a SHA-256 result hash for XLSX and PDF. Re-run the same options against an unchanged ledger and the figures reproduce exactly.

Cache that knows when to expire. A per-company move-version counter bumps atomically on every journal entry state change. A cache hit therefore means nothing has posted, drafted, or cancelled since the payload was built.

SQL with no room for injection. The reporting hot path runs through a parameterised, analytic-aware SQL builder. Every value binds as a parameter, every identifier comes from a fixed whitelist, and every query is company-scoped, so there is no raw interpolation and no cross-company leakage.

Know the scope boundary

This is an engine module, not a full end-user reporting pack. It exposes the shared audit log, report wizard, journal-entry PDF, and infrastructure; the complete financial-report catalogue (P&L, Balance Sheet, General Ledger, and so on) lives in the reporting modules that depend on it.

This module ships shared backend design tokens and the list-statistics field, but not the OWL financial-report viewer. The interactive viewer is provided by downstream reporting modules that consume this engine's payload contract.

Installation foundation

Odoo Accounting.

FOUNDATION

Accounting Setup Guide

The accounting suite refuses to silently default. Missing rates, missing accounts, missing approval groups all surface explicit errors.

20.0.1.0.6 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Choose the active company and review the relevant task list before treating completion percentages as a rollout decision.

2. Open the target configuration screen from each task, make the required business choices, and record completion or an explained skip.

3. Review unfinished tasks with the process owner and confirm that a skipped item represents an intentional scope decision.

4. Hand over the checklist with its notes, completion dates and responsible people so the next consultant can continue from recorded work.

A useful acceptance exercise

An implementation consultant finishes foundational configuration for one company while another company still has banking and closing work outstanding. Review each company's task list separately. A skipped task should represent an explained scope choice, not a concealed configuration failure, and the completion ratio excludes skipped work rather than treating it as completed configuration. Complete one representative task, record a note, and review the completion actor and time. Use the controlled reset path when a genuine configuration decision must be revisited. Ask the incoming administrator to open the configuration screen from the task and explain the remaining work without relying on the outgoing consultant's private spreadsheet.

Inspect these capabilities

Errors become a checklist. The suite's strict configuration errors are reframed as 26 tasks across 7 categories. Each row tells the operator exactly what is left and opens the screen to fix it, instead of failing at first use.

Fail-loud, never silent. A task whose deep link external id is missing, unresolved, or not an Odoo action raises a clear error naming the exact id, never a random fallback. The completion ratio excludes skipped companies from its denominator and reports completed work among active outcomes.

Per-company by design. One progress line per task per company, with a unique constraint and a global isolation rule. A multi-company tenant sees the checklist once per company, with independent progress and no cross-company leakage.

Know the scope boundary

This module tracks and links to configuration; it does not perform the configuration for you. Open takes you to the right screen, where you make the change.

Deep links open the target screen exactly as Odoo defines it. This module does not pre-filter the opened screen to the active company; only the checklist itself is company-scoped, by the global isolation rule.

Installation foundation

Accounting Suite Base, Odoo messaging.

REPORTING

Dynamic Account Reports

The financial reporting layer of the ERP Heritage accounting suite for Odoo 20 Community. Fifteen accountant reports are built on a single AbstractModel handler hierarchy and rendered through one OWL viewer, so the look and feel is uniform across every report.

20.0.1.8.3 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Choose the report that answers the business question, then state company and period scope before comparing totals.

2. Use period comparison and supported analytic columns where the report needs them, then expand account detail and inspect a relevant cell.

3. Trace selected totals to their scoped journal items and compare the screen with its PDF or XLSX output.

4. Retain the report parameters with the exported pack so a reviewer can distinguish an operating report from a differently scoped rerun.

A useful acceptance exercise

A controller sees an unexpected movement in expenses compared with the prior quarter. Start with a consistent company and posted-ledger scope, then compare the intended periods. Expand the relevant account hierarchy and drill into the amount that prompted the question. Where analytic columns are supported, review a chosen allocation without confusing the allocated view with the total company result. Export the reviewed report to PDF and XLSX and compare a selected line and its context across the screen and files. If the management pack also contains cash flow or open-item reports, document their different interpretation: a period flow, a point-in-time financial position and current outstanding receivables are not interchangeable measures.

Inspect these capabilities

Fifteen standard reports. Executive Summary, Deferred Revenue, Deferred Expense, Bank Reconciliation, Trial Balance, P&L, Balance Sheet, General Ledger, Partner Ledger, Aged Receivable, Aged Payable, Cash Flow, Customer Statement, Vendor Statement, and Analytic Balance.

Customer + Vendor Statements. Both sides; the customer statement also lands on the customer portal home for self-service.

Currency-aware rendering. Every monetary cell renders with the company currency symbol; the XLSX writer builds a matching Excel number-format string so the spreadsheet matches the screen cell for cell.

Know the scope boundary

Retain the report parameters with the exported pack so a reviewer can distinguish an operating report from a differently scoped rerun.

Installation foundation

Accounting Suite Base.

REPORTING

Dynamic Reports Pro

Dynamic Reports Pro adds four capabilities on top of the free Dynamic Accounting Reports engine: scheduled multi-channel delivery, a form-driven custom report builder, per-user saved views, and multi-period forward projection.

20.0.1.1.14 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Design the custom report structure in the builder and verify account selections, signs and formula references using a known period.

2. Save the intended filter set, then configure the schedule cadence and the delivery channels that the organisation actually uses.

3. Inspect the generated report and delivery history; review projections separately from historical figures and document their assumptions.

4. Give the report owner responsibility for recipients, webhook configuration, forecast inputs and changes to the report definition.

A useful acceptance exercise

A finance team needs a monthly report with revenue, selected operating costs and an arithmetic subtotal. Create a small custom definition using known account selections and inspect the result before adding delivery. Save the intended report options and choose a relative period that will resolve correctly when the schedule runs, rather than permanently fixing the first month's dates. Test the selected PDF or XLSX output, recipients and any configured webhook channel. Review delivery outcomes channel by channel. If a forward projection is included, label its baseline and growth method clearly and inspect the rounding of subtotals. Historical results, forecast assumptions and the success of a delivery attempt answer three separate questions.

Inspect these capabilities

Custom report builder. Define sections, account roll-ups and formulas in a form, then drag rows into the required order. Publish the report so users can run, schedule and export it through the standard report viewer.

Scheduled delivery. Send reports to the selected recipients on the agreed schedule. Each report runs independently; a failed delivery is recorded for follow-up while the other scheduled reports continue.

Multi-period forecasting. Projects complete calendar-month baselines using flat or compound growth. Only current monetary cells grow; historical comparisons and ratios remain unchanged.

Know the scope boundary

Give the report owner responsibility for recipients, webhook configuration, forecast inputs and changes to the report definition.

Installation foundation

Dynamic Account Reports.

REPORTING

Financial Dashboard

One screen summarises a company's financial state and opens the records behind its actionable figures. Six core tiles show cash-account balance, current open receivables (total, overdue and oldest overdue age), current open payables (total and overdue), and selected-period revenue, expense and net.

20.0.1.5.5 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Select the company and period deliberately and distinguish current open-item figures from period-based revenue and expense.

2. Use the visible control tiles and attention items to open the records behind an unusual amount or pending task.

3. Compare operating trends with a suitable detailed report and check why a control section appears or is absent for the installed modules.

4. Turn the dashboard into a daily review routine with named owners for receivables, payables, reconciliation and close actions.

A useful acceptance exercise

The finance manager opens the dashboard for Company A before the weekly meeting. Review current open receivables and payables separately from the selected period's revenue and expense. A receivable settled today can change the open-item view even when the meeting still discusses last month's P&L. Inspect cash-account balance using its disclosed cumulative basis. Choose one overdue item and one operating variance and follow each to the appropriate detail. Then switch company and confirm that the meeting is now discussing a different scope. Optional suite sections should be interpreted against the modules and records actually installed, rather than as a promise that every control appears in every database.

Inspect these capabilities

Explicit company and date scope. Ledger queries bind the dashboard company and selected date or as-of boundary. Cash uses cash-account accounts, open AR and AP use current residuals, and operating P and L excludes proven year-end close and reversal entries.

Visible-tab polling. Manual refresh is always available. The 60-second clock pauses while the browser tab is hidden, refreshes once when it becomes visible, and does not start an overlapping snapshot request.

Tiles that know your suite. Six core tiles always show; up to eight optional tiles light up only when the matching module is present, detected by probing the live registry. Absent modules contribute zero and never raise, so the same dashboard works on a base install or the full suite.

Know the scope boundary

Read-only. The dashboard posts no journal entries and changes no accounting state.

Overdue means anything past its maturity date as of today. There is no configurable cut-off, grace-day setting or aging-bucket parameter; the receivables tile does surface the oldest open item's age.

Installation foundation

Accounting Suite Base, Dynamic Account Reports, Odoo Accounting.

BANKING AND PAYMENTS

Bank Reconciliation Pro

Bank Reconciliation Pro gives Odoo 20 Community a reconciliation experience built around a scored suggestion engine and a tamper-evident audit trail.

20.0.1.3.4 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Select the bank work to clear and review suggested candidates alongside the bank's original transaction information.

2. Inspect amount, date, partner and reference evidence, then confirm an appropriate candidate or a supported combination of items.

3. Review exceptions and the decision history; a confidence score supports judgement and does not prove the underlying commercial transaction.

4. Assign controlled undo and unusual write-offs to the appropriate reviewer and keep reconciliation rules understandable to the operating team.

A useful acceptance exercise

A bank statement includes a customer receipt with an abbreviated reference and several open items of similar value. Review candidate amounts, dates, partner information and reference evidence. A high combined score is useful prioritisation, but the operator still needs to establish which commercial debt was settled. Inspect more than the amount signal before choosing the match. Use a known test receipt that pays several eligible items and review the supported multiple-candidate match. Include an exception that needs a person to resolve it rather than forcing a low-quality match. Finally inspect the decision history and the controlled undo path available to managers so the team knows how an incorrect reconciliation can be corrected.

Inspect these capabilities

Five signals, shown. Candidates are ranked by amount, date proximity, partner, reference token overlap, and 90-day history, with a per-signal confidence breakdown surfaced in the workspace. The operator sees why a match was suggested before confirming it.

An audit trail that cannot be rewritten. Every match records the user, time, confidence, rules fired, and whether it was an accepted suggestion or a manual override. The rows refuse write and unlink at the model level, so the decision trail stays intact.

Yours to keep. LGPL-3 source on disk. No activation key, no phone-home, no recurring licence.

Know the scope boundary

Safe auto-reconciliation is available, but it requires a high, unambiguous score and an exact company-currency amount unless a specific auto-confirm rule proves the decision.

Statement filters are session-local; saved filter presets and amount-range filtering are not included.

Installation foundation

Accounting Suite Base, Odoo Accounting.

BANKING AND PAYMENTS

Bank Statement Import

Bank Statement Import Pro reads bank statement files into Odoo 20 Community bank statement records, ready for reconciliation. It ships five native parsers behind a single pluggable registry: CSV with a per-bank column profile (column mapping, date format, decimal separator, currency), OFX, QIF (Quicken Interchange Format), CAMT.053 (ISO 20022), and MT940 (SWIFT) including the multi-line :86: extension blocks for end-to-end reference and counterparty extraction.

20.0.1.3.11 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Choose the file format and CSV profile, or install and configure the separate optional provider adapter for the intended company and bank journal.

2. Import a representative file, or run a complete provider update and inspect its result before beginning reconciliation.

3. For Plaid, inspect Bank Feed Changes as well as the successful import count; a completed sync can still contain unresolved changes to older transactions.

4. Compare the preserved original with provider evidence, perform any needed accounting work through normal authorised controls, and record notes before acknowledging the review.

A useful acceptance exercise

A bookkeeper downloads a statement on Monday and receives a corrected delivery on Tuesday. Import the first file into the correct bank journal, then inspect its transaction references and totals. Reimport a representative transaction in a test database to see exact duplicate handling. Do not assume every bank or feed uses the same transaction identifier. Add a second-source example with a different identifier but a similar amount, value date and narration. Review whether it needs fuzzy-duplicate investigation rather than automatic removal. For CSV, include a decimal-separator or date-format variation. Keep the accepted profile and import outcome with the bank's original file so reconciliation begins from traceable input.

Inspect these capabilities

Five formats, one registry. CSV with per-bank column profiles, OFX, QIF, CAMT.053 against the ISO 20022 element tree, and a full MT940 SWIFT parser with :86: subfield extraction, all behind a pluggable parser registry. A new format is a registered class, not a fork.

Atomic optional Plaid sync. The separate Plaid adapter gathers the complete update before new booked rows, review evidence and progress are saved together. Failed pages or accounting operations retain the previous cursor. New pending rows are excluded.

Bank Feed Changes. Provider corrections, removals and legacy pending replacements preserve existing accounting and enter a review queue. Add review notes before acknowledgement. Acknowledgement performs no correction, deletion, reversal or unreconciliation.

Know the scope boundary

The base importer supplies provider placeholders; live feeds require separate adapters, credentials, consent and provider commercial terms. Configuration screenshots and mocked tests do not establish live service acceptance.

Initial Plaid imports use the starting date; later cursor updates retain valid backdated movements. Basiq and GoCardless retain their own flat additions contract; OFX file import needs the ofxparse package.

Installation foundation

Accounting Suite Base, Odoo Accounting.

BANKING AND PAYMENTS

Batch Payment

Run a single batch instead of N individual payments. Open the build wizard, pick the open invoices or vendor bills to clear, choose whether to aggregate, and the wizard creates one draft payment per source or one net payment per compatible partner, receivable/payable account, currency and reviewed recipient bank.

20.0.1.1.17 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Build a coherent payment batch with one company and the supported journal and payment direction.

2. Review the proposed individual payments and move the batch through its configured approval and posting workflow.

3. Check that exceptions are resolved before posting and reconcile the resulting standard payment records to the intended run.

4. If a bank file is required, pair the batch with the relevant export module and keep the file acceptance process under treasury ownership.

A useful acceptance exercise

Accounts payable proposes a batch for several suppliers. Review the eligible items, company, payment direction and bank journal before submission. Check that one unusual payment is resolved at the right stage instead of assuming that the remainder of the run makes it safe to continue. Each resulting payment must still correspond to an intended settlement. Walk the test batch through its approval roles and review the individual standard payment records after posting. If a SEPA credit-transfer extension is in scope, inspect the separately generated file and its totals. Distinguish approval of the internal payment run from permission to upload or authorise funds at the bank.

Inspect these capabilities

One bad payment stops the whole run. Posting is atomic. A closed period, invalid payment or reconciliation failure rolls the whole attempt back, leaving every member unposted and the reviewed batch confirmed for correction.

Plain payment underneath. The batch creates and posts standard Odoo payments with only a nullable batch link added. Reconciliation, the vendor ledger, partner follow-ups and reporting already understand the output.

Mandatory two-manager approval. One EH Accounting Manager confirms and freezes the batch. A second, different EH Accounting Manager must post it.

Know the scope boundary

Maker-checker separation is mandatory: a single manager cannot both confirm and post, and the control is not configurable.

There is no payment ordering by invoice due date. CSV rows are ordered by partner.

Installation foundation

Accounting Suite Base, Odoo Accounting.

RECEIVABLES

Collections Workbench

Collections Workbench turns the aged receivable report from a passive dashboard into an active workflow. A single GROUP BY SQL pass over open receivable lines applies each company grace period and creates one collections case per overdue commercial customer per company, idempotently, so the nightly cron updates totals rather than duplicating cases.

20.0.1.2.8 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Review newly created and existing cases, checking the customer balance and previous contact before taking action.

2. Move cases through the appropriate follow-up stage, record activities and promises, and use the letter workflow when authorised.

3. Check overdue promises and escalation evidence alongside the current invoice position so paid debt is not chased from a stale view.

4. Maintain follow-up policy and contact ownership; legal escalation and commercial disputes remain business decisions for the organisation.

A useful acceptance exercise

A customer has several overdue invoices and promises to pay on a specified date. Open the case and review the current debt and prior contact before sending another message. Record the promise and its amount so the next collector can see what was agreed. An open case is a work record, not proof that every invoice in it remains unpaid. After the promise date, compare the actual customer position with the recorded commitment. Review an escalation when payment did not arrive and a resolved case when it did. Check that follow-up letters and activities become part of the history, giving the supervisor enough context to distinguish a missed promise from a disputed invoice.

Inspect these capabilities

The report that chases for you. One GROUP BY SQL pass builds a case per overdue customer from open AR and refreshes it nightly. The follow up cron picks the next due level per case and sends it, so the queue moves whether or not a collector logs in.

A history you cannot rewrite. Every call, email, follow up, and broken promise escalation writes a row to an action log that blocks write and unlink at the model level. Auto creation is idempotent and de duplicated by a partial EXCLUDE constraint, so re running the cron never doubles a case.

Yours to keep. LGPL-3 source on disk. No activation key, no phone home, no recurring licence.

Know the scope boundary

Pausing a case is a single tracked toggle. The follow up cron skips paused cases and manual sends are still permitted, but there is no pause reason field and no automatic resume date.

A recorded promise to pay does not pause or roll back the follow up timer. Promises are surfaced and a lapsed promise is escalated overnight, but the next follow up date is driven by the level and last send date, not by the promise.

Installation foundation

Accounting Suite Base, Odoo messaging, sms.

RECEIVABLES

Customer Credit Limit

Use the same company-dependent customer credit amount throughout native Odoo and EH credit controls. This module adds a warn-or-block invoice-posting policy to that shared amount, combines customer exposure across the authorised accounting-branch scope, and records manager exceptions.

20.0.1.4.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Set the native company credit default and choose the company's default enforcement policy.

2. Prepare a customer invoice and inspect the exposure warning before posting.

3. Review the proposed exception on the specific invoice, including customer, company, amount, current limit and exposure.

4. Review recurring overrides and customer terms periodically.

A useful acceptance exercise

A customer's recorded exposure is near the company's permitted limit and another invoice is ready to post. Inspect the configured policy, partner-specific limit and exposure used at the posting point. The operational question is whether this additional receivable should be accepted under that policy, not whether the customer's order is commercially attractive. Exercise an allowed case and an over-limit case in a test database. Where a manager approves an exception, review its stated reason and link to the affected document. Include a later review of repeated overrides for the same customer so the organisation can decide whether its limit or collection policy needs attention.

Inspect these capabilities

One amount and default. Native Odoo and EH share the company-dependent customer amount and company default. Policies choose enforcement. Explicit customer zero disables the amount check; resetting the native Partner Limit restores the company default.

Reviewed upgrade conflicts. Previous terms remain as evidence. Conflicting explicit native and EH values require a manager review and pause affected posting. Keep Native Limit or Use Previous EH Limit records the amount, actor and time.

Invoice-specific exceptions. A saved reason defaults to 24-hour validity; zero hours disables expiry. Changed reviewed inputs, expiry or revoked reviewer permission require fresh review. Completed exceptions retain append-only evidence.

Know the scope boundary

The enforcement point is customer invoice or credit-note posting. Including confirmed sales commitments in exposure does not block sales-order confirmation.

Limits use the company currency. Customer due diligence, commercial decisions and review of repeated exceptions remain with the organisation.

Installation foundation

Accounting Suite Base, Odoo Accounting.

RECEIVABLES

Recurring Invoices Pro

Real recurring customer invoices for Odoo 20 Community Edition. Templates, not workarounds.

20.0.1.1.3 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Set up the template using the agreed customer terms and review the first scheduled date and invoicing interval.

2. Generate or process due occurrences and inspect the resulting standard invoices before relying on an automated posting choice.

3. Review failures, pauses and repricing changes, and confirm that the next billing date matches the intended commercial cycle.

4. Keep billing ownership separate from revenue recognition; use the dedicated bridge when recurring bills must feed an IFRS 15 contract.

A useful acceptance exercise

A customer's monthly service changes during the billing relationship. Inspect the template's next date, recurrence and lines before changing the future billing instruction. Review the generated invoice as an ordinary accounting document and confirm whether the configured process prepares drafts or posts automatically. Changes to a template should be distinguished from edits to already issued invoices. Pause and resume a representative template and inspect the next scheduled occurrence. Include a template with incomplete configuration to understand how its failure is recorded without treating the entire queue as successful. Where revenue recognition is in scope, review the separate contract link and deferred treatment rather than equating the billing cadence with earned revenue.

Inspect these capabilities

The cadence is real, not a calendar trick. An arbitrary N interval over five built-in units (day, week, month, quarter, year). Every 2 weeks, every 6 months, monthly, quarterly, yearly are all settings.

One bad template never freezes the queue. The daily cron isolates each template in its own savepoint. A generation failure rolls back the partial invoice and counter change, retains the billing period, and pauses the template with recorded error evidence.

Standard invoices, yours to keep. Output is plain journal entry customer invoice records, so core reconciliation, the customer statement, and every report already understand it. LGPL-3 source on disk, no activation key, no phone-home, no recurring licence.

Know the scope boundary

Each template has an explicit transaction currency. Generated invoices use it, while subtotal, MRR and ARR are also converted to company currency at the next billing date for comparable reporting.

This module does not email or send the generated invoice. It creates the journal entry and only optionally posts it when auto-post is set; delivery is left to your standard Odoo flows.

Installation foundation

Accounting Suite Base, Odoo Accounting.

BANKING AND PAYMENTS

Post Dated Cheques (PDC)

Post dated cheques are part of normal trade in many markets, and Odoo Community has no native handling. This module makes the cheque a real record, not a memo note on a payment.

20.0.1.2.7 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Register the instrument in the correct direction and company, with the due date and accounting configuration needed for its lifecycle.

2. Move the cheque through the supported presentation and clearance actions as the underlying bank evidence arrives.

3. When a cheque bounces or changes status, inspect the associated ledger effects and the complete instrument history.

4. Reconcile the cheque register to bank and clearing balances and give unusual instruments a named treasury owner.

A useful acceptance exercise

A customer supplies a post-dated cheque for a debt. Register its direction, amount, currency, due date and supporting references. Follow the instrument as it is presented to the bank, then use bank evidence to determine its next lifecycle action. The cheque's face value and the customer's settled balance should not be confused merely because the instrument has been recorded. Use a test cheque that bounces and inspect the register history and associated entries. For a foreign-currency example, also review the currency amounts and relevant accounting dates. Reconcile clearing and bank balances to the resulting state, giving the responsible collector a clear record of the returned instrument and the customer follow-up still required.

Inspect these capabilities

Real records, real entries. Every cheque is a queryable, exportable, audit-ready record. Presentation uses dedicated direction-specific cheque transit; clearance uses Odoo outstanding accounts until bank reconciliation confirms cash.

The book is the source of truth. Serial allocation takes a Postgres row lock so concurrent registrations queue rather than race, rejects out-of-order serials, and exhausts the book automatically. A unique constraint on book and number is the backstop.

Yours to keep. LGPL-3 source on disk. No activation key, no phone-home, no recurring licence.

Know the scope boundary

There is no write-off transition. A bounced cheque can be replaced or left bounced; configured charges post to expense and outstanding payments, while full transit reconciliation recognises clear-date FX.

The cron auto-presents both issued and received cheques on their value date. There is no per-direction or per-bank-policy switch.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

RECEIVABLES

Customer Portal Extra

Customer Portal Extra turns the standard Odoo 20 Community customer portal into a self-service accounts receivable corner. It adds two things and does them carefully.

20.0.1.0.8 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Confirm the customer's portal identity and the commercial partner relationships that should define its statement scope.

2. Let the customer choose a supported statement period and generate the statement from the portal.

3. Compare representative customer output with the back-office report and verify that an unrelated customer cannot expand the ledger scope.

4. Include statement access in the customer-service handover and keep account reconciliation questions with the responsible finance contact.

A useful acceptance exercise

A customer wants its statement before month-end. Give the actual portal user access and choose a valid date range from the statement form. Compare the result with the back-office statement for the same commercial relationship and company context. The customer should not need to choose an unrestricted ledger partner or company in order to receive the correct document. Test a child contact that legitimately belongs to the customer relationship and a separate unrelated customer. Inspect open-invoice counts without assuming credits or payments should be presented as overdue invoices. Include an invalid or reversed date range to review the user-facing response, and document where the customer should direct reconciliation questions.

Inspect these capabilities

The customer selects the statement. Start date, end date and open-item or activity type are available directly on the portal card. No email request or back-office task is needed.

Same computation as the back office. The private render uses the same customer-statement handler and records options plus the exact PDF hash without storing a reusable source payload.

No caller-selected ledger scope. The authenticated route derives the commercial partner and active company from the session. Query-string partner or company values never select report data.

Know the scope boundary

Each successful render has a durable execution row, normalized options, and exact PDF hash, but the customer PDF bytes are intentionally not retained for later replay.

Portal queries are explicitly scoped to the signed-in commercial partner and active company. The feature does not combine sister-company ledgers into a consolidated statement.

Installation foundation

Accounting Suite Base, Dynamic Account Reports, Odoo Portal, Odoo Accounting.

PAYABLES AND APPROVALS

Vendor Bill Automation

A vendor bill intake pipeline that takes routine bills off the manual key-in queue while keeping every posting under human control.

20.0.1.4.8 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Configure vendor-specific extraction and intake rules using sample documents whose expected values are already known.

2. Prepare the bill from intake and inspect extracted fields, duplicate warnings and the three-way match against purchasing evidence.

3. Resolve quantity, price and receipt exceptions with the buyer or receiving team before the human-controlled posting step.

4. Treat document extraction as preparation assistance; agree who verifies unreadable or nonstandard files and missing purchasing evidence.

A useful acceptance exercise

A supplier invoice references a purchase order, but the receiving team has recorded only part of the delivery. Inspect the extracted header and lines, then compare the bill with the purchase and receipt evidence under the configured tolerances. A successfully read invoice number does not settle the question of whether the quantity may be billed. Review a duplicate vendor reference as a separate intake exception and include one document that the configured extraction cannot read adequately. Assign the mismatch to the appropriate buyer or receiver before posting. If live OCR is required for the source documents, arrange its separate provider extension and test it with actual files rather than assuming regex preparation covers every scan.

Inspect these capabilities

A real three-way match. Not field names that sound like a match. Each line is matched to its PO line, the received quantity is read from done stock moves, and price is compared in the bill currency after FX conversion.

Posting stays with a human. Matched-within-tolerance intakes are flagged ready to post; an accounting manager posts them, alone or as a selected batch, in one action. Posting is never automatic, and it re-checks duplicates at post time.

Yours to keep. LGPL-3 source on disk. The shipped regex parser makes no remote calls.

Know the scope boundary

Posting is never automatic. Matched intakes are flagged ready and a manager posts them; there is no auto-post on match.

The shipped regex parser extracts only the vendor reference and the total from the raw text. Vendor is resolved from the sender email or set manually, and due date and line items are entered by hand or via an optional extractor adapter.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo Purchase, Odoo Inventory, Odoo messaging.

PAYABLES AND APPROVALS

Approval Workflow

Approval Workflow is the corporate spend control most Community accounting stacks skip: a configurable approval chain that blocks journal entry posting until a defined set of approvers has signed off.

20.0.1.2.9 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Define the approval policy and group membership for the relevant bill and journal-entry scenarios.

2. Submit a representative document and follow the required sequence, checking how approvers receive and complete their work.

3. Change a material field in a test case and review the effect on prior approval before trusting the posting control.

4. Assign policy maintenance and overdue approval follow-up to a process owner and retain decision evidence with the financial document.

A useful acceptance exercise

A vendor bill is approved and then someone changes a material amount or accounting detail before posting. Use this situation as an acceptance case for the policy: the organisation needs an approval of the current document, not merely a historic green status. Inspect how the required request and decision evidence relate to the changed document. Walk a second example through more than one approval band and group. Include an overdue request to review the supported escalation and reminder path. Assign policy maintenance to a finance owner and verify the actual posting gate with the intended users; hiding a button alone is not the control being evaluated.

Inspect these capabilities

Posting is the enforcement point. The gate sits on the journal entry post pipeline, before sequence numbering and reconciliation fire. Until the chain reaches approved, the move cannot post, and the block names the exact policy, pending group, and step that stopped it.

Concurrency and audit, not just a status field. Two approvers clicking at once cannot both advance a step: an atomic compare-and-set with a stale-step guard lets one win and hands the other a clean retry. Every transition lands on an append-only log whose fields are immutable and whose deletion is refused at the model level.

A tested SLA engine, not a checkbox. Per-rule SLA hours compute a due time and an on-track, at-risk, or breached state. An hourly cron posts chatter and queues the shipped email reminder and escalates a breached request exactly once to a configured group, with per-record database savepoints and error isolation so one bad rule...

Know the scope boundary

Withdraw and restart operate on the whole request; there is no per-signature un-approve action.

Material re-approval uses currency-rounded amount changes and configured percentage and absolute thresholds; watched business fields remain fixed in code.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

ASSETS AND REVENUE

Fixed Assets and Leases

A first class fixed asset register and IFRS 16 lessee accounting engine for Odoo 20 Community. No paid Enterprise modules required.

20.0.1.5.9 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Prepare the asset, lease or deferral with its governing dates and accounting choices, checking a sample schedule against the contract.

2. Run the relevant depreciation, lease or deferred-recognition actions and review the period records before posting.

3. Inspect the supported revaluation, impairment, modification or disposal path when circumstances change instead of overwriting posted history.

4. Reconcile the register and schedules to the general ledger and preserve the underlying contracts and valuation evidence outside the calculation alone.

A useful acceptance exercise

An asset is first put into service part-way through a period while a warehouse lease is modified later in the year. Review the asset's method, dates and schedule before posting depreciation. For the lease, inspect the original liability, remaining payment terms and the modification inputs before evaluating the recalculated schedule. Choose one supported exception, such as an impairment reversal or lease termination, and reconcile its journal effect to the register history. Distinguish primary posting schedules from parallel reporting books. Preserve the asset evidence and lease contract with the workpaper so a reviewer can assess the assumptions instead of relying only on a generated schedule.

Inspect these capabilities

The hard parts, done right. IFRS 16 leases with present value measurement, modification remeasurement at the revised rate, and a schedule where principal plus interest always equals the payment. IAS 36 impairment with a dual reversal ceiling and automatic re-amortisation.

Every period is a record. Depreciation, lease and deferral schedules are real persisted lines, one per period with computed charge, accumulated balance and net book value. Queryable, exportable and audit ready.

Yours to keep. LGPL-3 source on disk. No activation key, no phone-home, no recurring licence, and no paid Enterprise dependency.

Know the scope boundary

Additional tax, IFRS and management books are reporting only. Each generates a parallel schedule, but only the asset's primary schedule posts to the general ledger.

Each asset and lease carries its own currency and rounds every schedule amount to it, but there is no FX coupling inside this module. Foreign currency GL balances are revalued at period end by FX Period End Revaluation only if that module is installed.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

CLOSE AND ASSURANCE

Period Close Workflow

Period Close Workflow turns the repeatable month-end close that most teams run from a spreadsheet into a tracked process inside Odoo. Build a reusable checklist once, instantiate it for a period, work the tasks, request approval, and close, with a defensible audit trail at the end.

20.0.1.1.7 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Choose or maintain a reusable checklist, then create a period run with task instances for that specific close.

2. Assign and complete the work with its evidence, recording unresolved matters where the reviewer can see them.

3. Follow the sign-off chain and segregation of duties, checking that the run reflects completed work rather than template intentions.

4. Use the completed run as the handover record for the next close and update templates separately when the process changes.

A useful acceptance exercise

A monthly close includes banking, receivables, payables and reporting tasks, but a bank reconciliation still needs investigation. Review the period's task instances and their owners rather than editing the reusable template to make the open work disappear. Record evidence for completed tasks and leave the unresolved matter visible to the reviewer. Ask the designated reviewer to inspect the handover and follow the configured sign-off chain. Include a test in which the preparer tries to perform a restricted review action. After completion, consider whether the template needs a separate improvement for next month; the completed run should remain an account of the work actually performed for this period.

Inspect these capabilities

Segregation of duties, enforced. The preparer cannot request review. The reviewer cannot approve.

Templates and runs stay separate. A run copies the template into independent per-run task instances. Editing this period never mutates the template and never reaches back into a prior closed run.

Yours to keep. LGPL-3 source on disk. No activation key, no phone-home, no recurring licence.

Know the scope boundary

There is no hard predecessor lock. Tasks carry a sequence for display order, but any task can be worked in any order.

Sign-off events are append-only model records. Signer, timestamp, task-completion and state anchors are server-owned and guarded against direct client writes.

Installation foundation

Accounting Suite Base, Odoo messaging.

CLOSE AND ASSURANCE

Year-End Closing

Year-End Closing computes the net result of a fiscal year from its posted journal entries, then generates one balanced closing entry that zeroes every income and expense account against a configured retained earnings account. The run is computed first, so the operator reviews the per-account profit-and-loss breakdown before anything posts.

20.0.1.1.7 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Confirm the year boundaries and configured closing accounts, then compute the proposed close from the intended posted ledger.

2. Review the profit or loss and generated closing lines before the manager posts the closing entry.

3. Where corrections are needed, use the supported reversal and recomputation path and consider the applicable lock dates.

4. Archive the run with the year-end reporting pack and communicate any lock-date change to teams that still need to post adjustments.

A useful acceptance exercise

The controller computes the fiscal-year close and notices that a late adjustment must be entered before the final result is accepted. Inspect the proposed income, expense and retained-earnings movement before posting. Confirm the fiscal-year boundaries and intended closing journal rather than using an attractive-looking profit total as the only review. In a suitable test period, examine the supported reversal and recomputation process. Keep the original and correcting evidence linked, and consider what the company's lock dates permit. Compare operating P&L reporting with the closing result so engine-generated closing and reversal entries are not mistaken for new trading activity.

Inspect these capabilities

Compute, then look before you post. The run computes a per-account profit-and-loss breakdown read from posted journal entries, so the operator reviews every income and expense balance before a single line posts. Compute is idempotent: re-running unlinks and rebuilds the breakdown without duplicating.

Balanced by construction, every case. One closing entry zeroes all income and expense accounts against retained earnings and balances by construction. Net profit credits retained earnings, net loss debits it, and a net-zero year emits no retained-earnings line yet still balances because income equals expense exactly.

Manager-gated, fully stamped. Post and reverse are restricted to the EH Accounting Manager group. Computed, posted, and reversed each record the user and timestamp, tracked on chatter, with one run per company per fiscal year enforced at the database level.

Know the scope boundary

Disabling the optional lock advance requires a documented reason; it never bypasses a fiscal, hard or inherited lock already covering the posting date.

A reversed run may be recomputed only when its verified closing entry and exact verified reversal remain intact; lock, prior-period and chronology controls still apply.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

CLOSE AND ASSURANCE

FX Period End Revaluation

Translate open monetary foreign currency balances at the period end closing rate and post the unrealised gain or loss to P and L, per IAS 21 for the common case where the company keeps its functional currency in the ledger and transacts partly in foreign currencies.

20.0.1.7.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Confirm the eligible balances and rates for the selected company and date before starting the revaluation run.

2. Compute the adjustment lines and inspect original amounts, company-currency carrying values and the proposed revalued result.

3. Review missing-rate errors and exceptional items explicitly, then post the audited adjustment and its optional reversal configuration.

4. Reconcile the run to the ledger and distinguish period-end unrealised adjustments from the settlement effects of later payments.

A useful acceptance exercise

The company has an unsettled foreign-currency receivable at month-end. Review the original foreign amount, company-currency carrying amount and rate applicable at the selected closing date. Inspect the computed adjustment rather than entering a journal from a spreadsheet total with no line-level explanation. A missing rate should be resolved through configuration and evidence. Include an account that should not be treated as monetary to understand the eligibility boundary. Review the posted adjustment and any configured reversal date, then trace later settlement separately. The period-end revaluation and the eventual payment concern related exposure but different dates and accounting events.

Inspect these capabilities

IAS 21, done as a mechanism. Open monetary balances are retranslated at the closing rate and the unrealised gain or loss is posted to one balanced journal. Non monetary accounts (inventory, fixed assets, equity) are rejected even if a user flags them, because IAS 21 carries them at historical rate.

Lines are real records. Every adjustment is a queryable, exportable line carrying its closing rate snapshot, old and new balance, and partner. Each run stamps user and timestamp on every transition with full chatter, post and reverse are manager only, and a posted run cannot be re posted.

A missing rate stops the run. The ECB, Frankfurter and supported dated national feeds honour historical dates and weekend rules; latest-only sources identify the fixing date they actually returned. A configured fallback fills currencies the primary source omits.

Know the scope boundary

IAS 21 compliant for the common case where the company keeps its functional currency in the ledger and transacts partly in foreign currencies. It revalues open monetary balances, it is not a full foreign operation translation engine.

The hedge accounting engine installs and is functional, but it is not yet surfaced on a top level menu. Reach the hedge records through the Hedges action rather than a dedicated menu item.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

GROUP ACCOUNTING

Inter-Company Rules

Inter-Company Rules automates the mirror leg of trade between related entities on Odoo 20 Community. When a sale invoice or vendor bill posts and its partner is linked to another company (through the partner's Represented Company field, or through its commercial partner's company) and that destination company has an enabled inter-company config, the module builds the matching mirror in the destination company.

20.0.1.3.2 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Map the sister-company relationships and verify destination-company products, taxes, accounts and allowed access.

2. Post a supported source transaction and inspect the linked counterpart created under the destination-company rules.

3. Review commercial values, currency treatment and provenance on both sides before completing destination processing.

4. Resolve configuration failures through the responsible company owners and use the linked correction process for changes to mirrored transactions.

A useful acceptance exercise

Company A invoices Company B. Before posting the source, review the company-partner relationship, destination resolution and configured access. Inspect the generated destination document for the intended vendor, product, tax treatment, currency and reference. A matching gross amount alone does not prove that both companies have the correct accounting treatment. Repeat the source processing in a test scenario to review duplicate prevention and inspect a deliberate missing-mapping case. Confirm that the problem becomes explicit rather than creating a partial commercial result that staff cannot explain. Use the linked correction procedure for changes and retain references on both sides for reconciliation.

Inspect these capabilities

One post, both sides. A posted sale invoice builds the matching purchase bill in the sister company, and a vendor bill mirrors back to a customer invoice. Refunds mirror the same way.

Duplicate-proof by construction. Each mirror stores an origin pointer and a database-level unique(origin, company) constraint makes re-posting and concurrent posts idempotent. Two simultaneous posts cannot both create a twin bill, the constraint closes the race at the database.

Nothing fails silently. A stored lifecycle state with list badges, search filters and a dedicated review action means a supervisor sees only the pairs needing attention: no mirror, mirror draft, or an amount mismatch above one cent once both sides are posted.

Know the scope boundary

Mirroring does not convert currency. Both legs are created in the source invoice currency with the same per-line amounts; there is no day-rate conversion into the destination company's currency.

Routing is partner-driven, not a per-company-pair rule. The destination is derived from the partner's Represented Company and each company has its own config; there is no sender-receiver-journal pair object.

Installation foundation

Accounting Suite Base, Odoo Accounting.

GROUP ACCOUNTING

Group Consolidation

Define a consolidation entity once: presentation currency, root company, and the list of member companies with ownership percentage and method (full, equity, or proportional). Each period, run a consolidation.

20.0.1.3.1 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Define the group and period, checking the relationship between local charts and the target consolidation accounts.

2. Compute the consolidation from posted entity balances and inspect translation, elimination and non-controlling-interest results.

3. Trace material adjustments to their entity sources and review the currency translation adjustment before posting.

4. Retain the run and its mapping assumptions as the group-close evidence; local-company corrections and group adjustments require separate review.

A useful acceptance exercise

A parent and subsidiary close in different currencies. Define their membership and account mapping, then identify which balances use the configured translation treatment. Review the local posted source balances before assessing group adjustments. Inspect the currency translation adjustment, elimination and ownership effects as separate parts of the reconciliation. Choose a material account and trace it from entity evidence through mapping and translation into the consolidation run. Include an intercompany balance and a non-controlling-interest case when applicable. Retain the rates and mapping assumptions with the signed group workpaper so next month's preparer can distinguish a business movement from a configuration change.

Inspect these capabilities

A CTA that actually moves. Balance-sheet items convert at the closing rate, P&L at a time-weighted average rate weighted by days in effect. The gap is the CTA.

Every number has a source. Each run line is tagged parent, subsidiary, elimination, CTA, or NCI. You can see exactly where any consolidated figure came from, which is the difference between a number you can defend and one you cannot.

Posted-only, balanced, idempotent. Only posted member moves and posted eliminations feed a run. Eliminations must balance to post.

Know the scope boundary

The CTA remains fully source-tagged; an entity can stay review-only or post the reviewed snapshot to a dedicated consolidation ledger with preserved delta and reversal history.

Settled inputs, generated lines and accounting evidence are protected by model-level lifecycle locks, with manager-gated reset and reopen correction paths.

Installation foundation

Accounting Suite Base, FX Period End Revaluation, Odoo Accounting, Odoo messaging.

PLANNING AND ANALYSIS

Multi Version Budget Pro

Multi-version budgeting for Odoo 20 Community, built for finance teams that need a versioned, committed, audit-traceable budget without an Enterprise subscription.

20.0.1.3.11 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Create the budget version and agree its ownership, company, period coverage and analytic allocation before approval.

2. Compute actuals and review the variance direction, then assess commitments and purchase controls where configured.

3. Use the version history to distinguish an approved baseline from a working revision and review authorised exceptions explicitly.

4. Publish the relevant budget to reviewers and keep changes in planning assumptions visible rather than silently replacing the baseline.

A useful acceptance exercise

The marketing owner has an approved budget and a proposed purchase order. Select the correct version and period and inspect actual expenditure together with the applicable commitments. A working forecast must not silently replace the approved baseline when purchasing decisions depend on that baseline. Review the budget's company and analytic scope before comparing figures. Try a normal commitment and an amount that crosses the configured purchasing control. Inspect the permitted approval or override path and keep its reason with the decision. Then create or review a budget revision and explain which comparison is being presented to management, including the direction of favourable and unfavourable variance.

Inspect these capabilities

Budgets that stop a PO. An off/warn/block policy is enforced when a purchase order is confirmed, and the block path accumulates the required amount per budget line across every PO line before it checks availability. Several lines that each fit but together overrun are still caught.

Variance the right way round. Income, liability and equity accounts are sign-normalised before variance and availability are computed, so a revenue budget met to the dollar reads as zero variance, not a 200 percent overrun. A non-zero actual on a zero budget reads as a full 100 percent overrun rather than a...

Yours to keep. LGPL-3 source on disk. No activation key, no phone-home, no recurring licence.

Know the scope boundary

Actuals are computed from posted journal items only. There is no option flag to include draft or unposted entries.

The monthly split divides a line's budgeted amount equally across the calendar months it overlaps. It is not prorated by the number of days in each partial month.

Installation foundation

Accounting Suite Base, Odoo Purchase, analytic.

ELECTRONIC DOCUMENTS AND COMPLIANCE

Peppol eInvoicing

Peppol eInvoicing renders a posted journal entry into a Peppol BIS Billing 3.0 (UBL 2.1) Invoice or CreditNote XML, and ships the inbound side as well: a UBL parser and a bill-intake workflow that moves a received document through parsed, matched and posted to create the vendor bill.

20.0.1.9.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Check company and partner identifiers and select the access-point integration that the deployment will use.

2. Generate and validate an outbound document or parse an inbound invoice, inspecting the resulting financial data and workflow status.

3. Review validation failures and adapter responses before treating a document as delivered or an inbound draft as an accepted bill.

4. Assign credential and access-point support ownership; a document generator does not by itself provide a commercial network subscription.

A useful acceptance exercise

A posted customer invoice is ready for Peppol document generation. Review the legal parties, endpoint identifiers, tax categories and monetary totals before producing the UBL. Inspect the pre-flight validation outcome and understand its structural scope. A generated file and a successful local validation are not proof that an access point has delivered it. Use the manual file workflow or the separately installed live adapter appropriate to the deployment. For inbound work, inspect the supplier match and duplicate evidence before accepting the vendor bill. Include an ambiguous supplier or inconsistent-total example in testing so accounts payable knows what requires intervention and where delivery evidence is recorded.

Inspect these capabilities

A real generator and a real parser. Outbound emits the actual OASIS UBL 2.1 namespaces and the Invoice-2 and CreditNote-2 roots. Inbound is a parser plus a received to parsed to matched to posted state machine that creates the vendor bill.

Caught before the access point. Every payload is checked against the high-frequency Peppol and EN 16931 invariants (mandatory elements, single currency, totals reconciled within 1 cent) before download, and a failure names the rule. Participant identifiers are checksum-validated so an invalid ABN or GLN bounces with a precise message, not a rejection...

Yours to keep, yours to wire. LGPL-3 source on disk, no activation key, no phone-home. Transport is bring-your-own through a published adapter contract, and the journal entry payload builder is split into override methods so a localisation can enrich party identification and per-line tax mapping without forking the module.

Know the scope boundary

No live AS4 transmission is included. A real adapter registry, submit/poll contract and a manual file-drop stub ship in-module, but live access-point transport requires a separate ERP Heritage adapter module registered under the same key.

Validation is structural, not full XSD. The pre-flight checker enforces the high-frequency Peppol and EN 16931 invariants (mandatory elements, single currency, total reconciliation), not the complete OASIS XSD schema; no .xsd files ship.

Installation foundation

Accounting Suite Base, EH EDI Core, Odoo Accounting, Odoo Purchase.

BANKING AND PAYMENTS

SEPA Credit Transfer

SEPA Credit Transfer builds ISO 20022 credit-transfer files for posted vendor-payment batches. Each batch explicitly opts into SEPA controls; merely configuring an originator never changes ordinary outbound batches.

20.0.1.3.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Agree the bank's accepted file version and check debtor and creditor bank details before generating a file.

2. Generate the supported credit-transfer XML from the eligible batch and inspect validation messages and payment totals.

3. Review the exact file presented to the bank and maintain the distinction between file creation, bank acceptance and settlement.

4. Keep bank onboarding, upload permissions and payment authorisation under treasury control; these are outside a local XML download.

A useful acceptance exercise

Treasury prepares an eligible outbound batch for suppliers with European bank accounts. Check debtor details, beneficiary IBAN and BIC where required, the requested execution date and the bank's accepted PAIN version. Generate the selected XML and compare its counts and totals with the approved payment run. Include an invalid bank detail and a repeated generation request in the acceptance exercise. Review the file history and correction process before sending a live file. Confirm how the bank receives, validates and authorises payment files: the module's output is one step in that process and does not itself evidence bank acceptance or final settlement.

Inspect these capabilities

Caught before the bank. IBAN passes a pure Python mod-97 check, country in the SEPA zone with the exact per country length, and BIC against ISO 9362 structure. No external library.

The file your bank actually wants. Pick PAIN.001.001.03 (legacy SEPA rulebook) or PAIN.001.001.09 (current EU Implementation Guidelines, 2024 onward) per originator. The .09 path renames BIC to BICFI automatically so the same batch serves either bank.

Every file accounted for. Each export records user, timestamp, message ID, transaction count, control sum and SHA-256. A second live instruction is blocked until a manager voids the unsent file for re-cut, preserving every audit row.

Know the scope boundary

Currency is EUR only, fixed by the SEPA scheme. Non EUR transfers are out of scope, use a different transfer instruction.

The file targets the published PAIN.001.001.03 and .09 namespace and structure and carries the schemaLocation hint. It does not bundle an XSD or run xmllint or XSD validation; the tests assert structure by parsing the XML back, not by validating against a schema.

Installation foundation

Accounting Suite Base, Batch Payment, Odoo Accounting.

BANKING AND PAYMENTS

SEPA Direct Debit

SEPA Direct Debit for Odoo 20 Community collects EUR payments from customer bank accounts via the SEPA Direct Debit scheme. It pairs with the Recurring Invoices module for subscription collection and with Batch Payment for ad-hoc collection runs.

20.0.1.2.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Register mandate evidence and review status, sequence and dormancy before preparing the collection cut.

2. Generate the supported direct-debit XML for eligible items using the company's creditor and booking policy.

3. Inspect mandate consumption and amendment history, then check the bank's response through the organisation's collection process.

4. Treat mandate authority, customer notification and bank scheme enrolment as operational responsibilities alongside the file generator.

A useful acceptance exercise

A customer has a recurring mandate and is due for another collection. Inspect its lifecycle, creditor identifier, debtor details, latest collection information and any relevant amendment. Review the appropriate sequence and scheme choice before including the item in the next XML cut. A valid-looking bank account is not a substitute for mandate authority. Add a dormant mandate and a duplicate collection attempt to the test set. Examine how the supported checks and consumption history explain eligibility. Keep pre-notification, scheme enrolment and the bank's rejection or return handling with the collection process owner rather than assuming they are completed by downloading a file.

Inspect these capabilities

PAIN.008 generation. Targets the published namespace and validates generated output against the official PAIN.008.001.02 XSD in the cross-version gate.

Atomic consume. On collection the mandate consume bumps the FRST to RCUR counter via SQL UPDATE so concurrent collections cannot lose an increment.

36-month dormancy. The collection path and cron expire both used and never-collected mandates after 36 months from the controlling date.

Know the scope boundary

Treat mandate authority, customer notification and bank scheme enrolment as operational responsibilities alongside the file generator.

Installation foundation

Accounting Suite Base, Batch Payment, SEPA Credit Transfer, Odoo Accounting.

ASSISTED REVIEW

AI Agent Layer

A reusable AI helper layer for the ERP Heritage accounting suite. It ships three accounting-specific capabilities, each with a working deterministic default that runs with zero API keys and zero network access, plus an optional provider hook for sites that later want live language-model output.

20.0.1.3.1 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Start with the deterministic rules and review a representative ledger sample before adding a language-model provider.

2. Run the supported review workflow and inspect the evidence behind each generated finding or explanation.

3. Resolve false positives and material exceptions through normal accounting review; an automated suggestion is not approval to post or alter a transaction.

4. Document rule ownership and optional provider data handling so reviewers know how a result was produced and who can refresh it.

A useful acceptance exercise

A reviewer runs the deterministic checks over posted entries and sees a small group of unusual items. Open their evidence and ask whether each pattern has a valid explanation, a configuration cause or a genuine issue requiring follow-up. An anomaly label should prioritise review, not establish misconduct or require an automatic ledger correction. Record the review result using the available workflow and check that the company scope is appropriate. If the organisation wants additional narrative from a live provider, configure the separate extension deliberately and review its inputs and permissions. Keep the distinction between the recorded facts, a rule's interpretation and a generated explanation visible to the person making the decision.

Inspect these capabilities

Useful with zero configuration. Four anomaly rules, a variance template, and an eight-branch dunning ladder all run deterministically with no API key and no network. A site that never wants an LLM dependency gets real behaviour out of the box, and tests run end to end on the deterministic path.

Guards on every rule. The round-outlier rule self-suppresses below three positive amounts, variance handles zero-budget lines without divide-by-zero, the empty period still emits a placeholder line, and a threshold of zero deliberately disables the structuring rule. These are the small correctness cases cheaper helpers skip.

A hook, not a lock-in. A per-company provider key selects manual, claude, openai, or local. The variance hook already returns a live provider's paragraph when one is configured.

Know the scope boundary

Deterministic anomaly findings and review controls are complete in this package. Budget commentary and collections suggestions are displayed by their consuming suite modules rather than duplicated here.

Manual scans are capped at 200 selected entries and scheduled scans at 500 recent entries per company. These are bounded review controls, not unrestricted forensic population exports.

Installation foundation

Accounting Suite Base, Odoo Accounting.

ASSISTED REVIEW

AI Budget Commentary

Wires deterministic budget variance commentary live onto budgets in Odoo 20 Community. Each budget record gains a non-stored computed field that produces plain-English, direction-aware budget-vs-actual analysis without network access.

20.0.1.1.3 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Choose the budget version and review its actuals and variance calculation before requesting commentary.

2. Read the deterministic commentary and use the explicit refresh action where an optional provider narrative is appropriate.

3. Check whether the narrative is stale after the budget data changes and compare every explanation with the numerical source.

4. Edit the management narrative through the organisation's review process; the module does not establish business causes from accounting amounts alone.

A useful acceptance exercise

A budget owner reviews a period with both income and expense variances. First inspect the numbers, their signs and the applicable period label. Read the deterministic commentary as a structured summary of that snapshot. It cannot know, for example, whether a commercial campaign caused a variance unless that explanation has been supplied through the appropriate human process. Where an optional provider is configured, use the explicit refresh action and inspect the stored narrative evidence. Change a budget line in testing and check whether the earlier narrative is now stale. Reading or recomputing the normal commentary should not be confused with an authorised new provider request. Retain the reviewer's final explanation separately from an unverified draft.

Inspect these capabilities

Month-end narrative ready. Direction-aware commentary uses currency precision, symbol, and grouping, with the largest movers already picked out.

Works out of the box. Deterministic commentary runs on every read with no API key or network. Provider output is fetched only by the explicit confirmed refresh action.

No duplicate provider charge. Exact source and provider fingerprints prevent an unchanged budget from calling and billing the provider twice. Failures preserve prior evidence and show a user-facing error.

Know the scope boundary

Requires Budget Pro for budget facts and AI Agent for deterministic/provider infrastructure. It provides commentary, not forecasts or autonomous budget decisions.

Provider selection is scoped to the budget's own company; there is no parent-company inheritance, per-budget provider override, or per-user provider choice.

Installation foundation

AI Agent Layer, Multi Version Budget Pro.

ASSISTED REVIEW

AI Collections Advisor

A bridge module that wires the deterministic collections next-action engine live onto Collections case records. Every case gains stored, filterable action and priority keys plus a live translated rationale.

20.0.1.2.2 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Open the case and verify the current receivable position and recent customer contact before relying on a suggestion.

2. Read the stored action and rationale, refreshing the optional narrative only when its current source context warrants it.

3. Check stale-state indicators and compare the proposed action with current promises, disputes and the approved collection policy.

4. Keep customer communication and escalation with the authorised collector; the suggestion is decision support within the existing case workflow.

A useful acceptance exercise

A collector sees an overdue case whose customer has an active payment promise. Read the stored next action and rationale against that promise before escalating. In a second test, consider a broken promise with a different action history. The recommendation should be evaluated using the current case state and the organisation's contact policy. Review a disputed, paused or resolved case to confirm that a suggested next action does not overrule the underlying control state. If optional provider narrative is refreshed, inspect the authorisation, attribution and staleness evidence. Actual communication, agency referral and write-off decisions still require the responsible person and the existing business workflow.

Inspect these capabilities

Stored and filterable. Action and priority are stored dependency-driven selections, so managers can filter, sort, and group their work queue. Human rationale stays a live translated field.

Provider output is attributable.
Manager-confirmed provider output stores actor, time, provider, and exact SHA-256 source fingerprint. Changed case facts mark it stale; direct RPC writes are refused.

No duplicate provider charge. Refresh is singleton and manager-only. A row lock plus exact source/provider fingerprint makes unchanged retries idempotent before any network call.

Know the scope boundary

Suggestions never execute collection, write-off, legal, or agency action. A responsible person still reviews evidence and policy.

Provider refresh is deliberately synchronous, manager-only, singleton, and explicit. Form/list reads never invoke provider network I/O.

Installation foundation

AI Agent Layer, Collections Workbench.

FINANCIAL INSTRUMENTS AND RISK

IFRS 9 Expected Loss

Expected Credit Loss measures the loss allowance on trade receivables under IFRS 9. Each run is scoped to one legal entity and carries a provision matrix of contiguous, non-overlapping ageing buckets; population reconstructs point-in-time receivable residuals at the reporting date and fails closed when a matrix band or installed exposure provider is incomplete.

20.0.1.2.8 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Choose the supported impairment approach and assemble the exposure and risk inputs for the period.

2. Compute the run and review staging, scenario weighting, discounting and opening-allowance reconciliation.

3. Inspect the required closing allowance and the movement to be posted, keeping modelling assumptions with the evidence.

4. Reconcile the posted allowance to the relevant accounts and use the disclosure bridge where the separate notes module is installed.

A useful acceptance exercise

The period begins with an allowance recognised in the previous close. Assemble the current exposure and supported impairment inputs, then compare the computed closing requirement with that opening position. The review question is the required change and its evidence, not whether posting the entire closing allowance again produces a balanced journal. Inspect the chosen simplified or general approach, staging and any scenario assumptions used by the run. Resolve an opening mismatch through the supported evidence path and review the final movement. Where a disclosure module consumes posted ECL information, compare its note with the accepted source run instead of manually reproducing the numbers without provenance.

Inspect these capabilities

Post only what changed. The run recognises the movement from the opening allowance to the closing allowance in one balanced entry, debiting impairment loss and crediting the loss-allowance contra account on an increase and reversing on a decrease (IFRS 9.5.5.8), never re-posting the full allowance.

Simplified or general. The simplified provision matrix measures lifetime ECL as gross carrying amount at each bucket's loss rate. The general approach measures EAD times LGD times PD, using 12-month PD for Stage 1, lifetime PD for Stage 2, and an explicit keyed-lifetime or defaulted-100% policy for Stage 3.

Opening allowance that ties out. The opening allowance defaults by roll-forward from the prior posted run's closing allowance, and a warning fires when it disagrees with the loss-allowance ledger balance carried into the period, so the roll-forward is confirmed before you post.

Know the scope boundary

It covers trade receivables from the accounting ledger; it does not model loans, debt securities, lease receivables or off-balance-sheet loan commitments and financial guarantee contracts.

It does not calibrate loss rates, probabilities of default or LGD for you; you supply the matrix rates and the general-model risk parameters.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

FINANCIAL INSTRUMENTS AND RISK

IFRS 13 Fair Value

This module records and posts fair value under IFRS 13 with IFRS 9 classification. Each item (Fair value item (IFRS 13)) is classified in the three-level hierarchy by input observability, its valuation technique is captured as market, income or cost approach, and for Level 3 the significant unobservable inputs are documented.

20.0.1.1.8 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Record the instrument and its supported classification with the evidence used for business-model and cash-flow assessment.

2. Enter or prepare the valuation inputs, then compute the change using the selected measurement treatment.

3. Review asset versus liability signs and any reserve movement before posting or derecognition.

4. Preserve valuation evidence and classification judgement; the module records accounting mechanics and does not supply market prices or an external valuation opinion.

A useful acceptance exercise

An investment has a new period-end valuation. Confirm its classification and the route for the resulting movement before entering the fair value. Review whether the record represents an asset or liability and which profit-or-loss or OCI accounts apply. The same increase in a quoted value cannot be interpreted without that context. Use a supported derecognition example to inspect what happens to the recorded reserve, including any applicable recycling treatment. Keep the independent valuation and classification assessment with the case. The module's calculation and posting history explain the chosen accounting mechanics; they do not establish the market price or approve the investment's legal classification.

Inspect these capabilities

Assets and liabilities post the right way. The remeasurement leg knows whether the item is a financial asset or a financial liability. A rise in an asset is a gain that increases the balance-sheet carrying amount; a rise in a liability is a loss that increases the liability.

FVOCI classification with reserve recycling. Beyond a simple P&L or OCI switch, items carry an IFRS 9 classification: FVTPL, FVOCI-debt (recycles to profit or loss on derecognition) or FVOCI-equity election (transfers within equity, never recycled). The recycle action clears the accumulated OCI reserve to the correct destination and blocks a profit-or-loss transfer...

Every gap raises an explicit message. A missing journal, balance-sheet account, gain/loss or OCI account, a nil remeasurement, or a balance-sheet account that is actually a profit-or-loss account each stop the post with a clear error instead of writing a wrong or unbalanced entry.

Know the scope boundary

It does not fetch or feed market prices; you enter the fair value at the measurement date yourself, it does not connect to any pricing or market-data source.

It does not build the IFRS 13 sensitivity analysis or the full fair-value disclosure notes; it captures the unobservable inputs and the Level 3 roll-forward, but the narrative disclosures are not generated.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

FINANCIAL INSTRUMENTS AND RISK

Deferred Tax (IAS 12)

This module computes deferred tax under the IAS 12 balance-sheet liability method. Each temporary difference is entered as a carrying amount and a tax base; the gap, classified taxable or deductible from the item's nature (asset, liability, or tax loss), is measured at the enacted rate resolved from a per-jurisdiction rate table at the reporting date (IAS 12.47), with a reasoned manual override and a statutory fallback.

20.0.1.1.8 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Maintain the applicable rate information and identify the temporary differences to be assessed.

2. Compute the deferred-tax asset and liability position and review recognition, offsetting and the period movement.

3. Inspect the proposed posting and effective-tax-rate reconciliation against the company's supporting tax workpapers.

4. Keep enacted-rate decisions and recoverability evidence under tax-team review; entered tax bases and judgements determine the calculation.

A useful acceptance exercise

An asset's accounting carrying amount differs from its tax base at period-end. Enter the supported difference and enacted-rate information, then inspect the resulting deferred-tax position and recognition choices. Carry the reviewed opening position into the next close and focus on the movement needed to reach the new closing amount. Add a second item that raises a recognition or offsetting judgement and document the tax team's conclusion. Compare the proposed posting with the workpaper and effective-tax-rate reconciliation. A complete input table can still produce the wrong accounting result if the entered tax base, rate or recoverability assessment is not the approved one.

Inspect these capabilities

The liability method, done properly. Temporary difference equals carrying amount less tax base, classified taxable or deductible by nature, multiplied by the enacted rate. Assets, liabilities, and tax losses each follow the correct IAS 12.15-24 sign convention rather than a single flat formula.

Only the period movement hits the ledger. Each line carries an opening position, and the run posts the closing-less-opening movement as one balanced entry. Deferred tax asset and liability legs are debit and credit natured, and the expense or OCI counterpart is the balancing plug, so the entry ties to the cent.

Posted figures are frozen and manager-gated. Once posted or reversed, the measurement fields on the run and its lines are locked at the ORM layer. Posting, reversal, and cancellation require the EH Accounting Manager group, and each action is timestamped with the acting user.

Know the scope boundary

It gathers differences only from installed IFRS producers that implement the documented hook; other differences remain explicitly entered and reviewed.

Producer rows roll forward by server-owned source identity; hand-entered legacy rows use their frozen line name as the natural key.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

FINANCIAL INSTRUMENTS AND RISK

IAS 37 Provisions

A dedicated IAS 37 provision register for Odoo 20 Community. Each provision is recognised at the present value of the undiscounted best estimate, posting a debit to the expense account and a credit to the provision liability.

20.0.1.2.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Classify the matter using the supported provision or contingency path and retain the underlying assessment.

2. Build the cash-flow and discounting assumptions, then review initial recognition and later unwind or remeasurement.

3. Record utilisation, reversal or settlement through the available workflow and reconcile it to the provision's history.

4. Keep probability, legal and commercial judgements with responsible specialists; a calculation record does not determine whether an obligation exists.

A useful acceptance exercise

A business identifies a possible obligation and prepares cash-flow estimates. Record the assessment and select the supported provision or contingency path before entering a discounting calculation. Review the amount, expected timing and discount-rate basis. A numerical present value cannot itself determine whether the recognition conditions have been met. For a recognised provision, inspect later unwind, remeasurement and utilisation in the history. For a disclosure-only matter, check that the chosen treatment does not become an unintended ledger posting. Keep legal, contractual and reimbursement evidence with the responsible specialist and reconcile settlement activity to the remaining recognised provision.

Inspect these capabilities

Present value done properly. A pre-tax rate and a period count discount the best estimate to present value, and the Unwind Discount action accretes the carrying amount one compounded step per whole period that has fallen due, capped so it never overshoots the undiscounted estimate.

Contingencies never touch the ledger. Contingent liabilities and contingent assets are flagged as disclosure only. Recognising them is blocked at the action, and a validation constraint refuses any contingent item that reaches a recognised or settled state (IAS 37.27-28).

State follows the postings, not the keyboard. A recognised provision cannot be re-keyed to settled, reversed or cancelled by a raw write, and its measurement inputs freeze once posted. Transitions run only through the Utilise, Reverse and Cancel actions that post the matching journal entry.

Know the scope boundary

Period-end discount unwinding remains a deliberate manager action; the module does not post provision finance cost from a timer or cron.

Warranty population modelling is outside the register: teams supply the supported best estimate, while onerous-contract inputs and restructuring direct-cost components are measured and re-gated in the module.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

ASSETS AND REVENUE

IFRS 15 Revenue

This module implements the IFRS 15 five-step model on real journal entries. A revenue contract holds one or more performance obligations, each with a standalone selling price, and the transaction price is allocated across them in proportion to those prices (IFRS 15.74).

20.0.1.2.12 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Identify the supported contract obligations and allocation inputs before treating invoice dates as recognition dates.

2. Review the allocation and recognition schedule or progress measure, then record the contract's billing events.

3. Inspect contract asset or liability balances and the accounting effect of supported consideration changes and modifications.

4. Retain the commercial contract and judgement evidence with the review pack; the module needs the organisation's assessment of its enforceable terms.

A useful acceptance exercise

A customer buys an arrangement with more than one performance obligation. Record the supported obligations, standalone selling prices and transaction price before reviewing allocation. The customer may be billed upfront even though performance continues over time; inspect billing and recognition as separate contract events rather than equating the invoice date with satisfaction. Review one period's recognition and the resulting contract asset or liability. Add a supported modification or variable-consideration update in testing and explain which assumptions changed. Preserve the contract and the organisation's assessment of enforceable terms, progress and constraint decisions with the workpaper that supports the posted result.

Inspect these capabilities

The whole model, posted to the ledger. A contract, its performance obligations and their standalone selling prices drive an allocation of the transaction price (IFRS 15.74). Recognition posts the incremental amount since the last run, crediting revenue and clearing the contract liability first, then the contract asset (IFRS 15.105-107).

Contract asset and liability, always net-correct. Billing debits the receivable and credits the contract asset first, then the contract liability, while recognition works the other way. The two mechanics keep the net contract position, cumulative recognised less cumulative billed, correct on the balance sheet at all times (IFRS 15.106-107).

Variable consideration, financing, modifications. Opt-in per contract: constrain variable consideration to the highly probable amount (IFRS 15.50-59), allocate a bundle discount to the obligation it relates to (IFRS 15.81-83), discount a financing component with advance or arrears interest (IFRS 15.60-65), and apply separate, prospective or catch-up modifications (IFRS 15.18-21).

Know the scope boundary

It does not automatically read percentage of completion from timesheets, projects or milestones; progress is entered on each over-time obligation.

It does not generate customer invoices in the sales or invoicing app; the Record Billing action posts a receivable journal entry, it does not create an journal entry of type customer invoice.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

ASSETS AND REVENUE

Revenue Recurring Bridge

When both modules are installed this auto installs and adds an optional revenue contract link on the recurring invoice template. A linked template routes every generated invoice line to the contract's contract liability account instead of the line's income account, so recurring billing lands as deferred revenue on the balance sheet rather than immediate income.

20.0.1.0.5 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Confirm that the recurring template is intentionally linked to the relevant revenue contract and that deferred-account configuration is correct.

2. Generate a supported recurring invoice and review the deferred billing treatment and the linked contract billing evidence.

3. Compare the invoice with the contract's recognition history so billing and satisfaction of obligations remain distinct events.

4. Use this bridge with both parent modules; it extends their connection and does not create an independent subscription-management system.

A useful acceptance exercise

A subscription template is linked to a revenue contract with a deferred-account configuration. Generate one supported recurring invoice and compare its accounting with the intended contract billing treatment. Review the contract history to establish how the billing evidence arrived, then inspect recognition independently under the revenue engine. Repeat the exercise with an unlinked recurring template to understand the bridge's deliberate boundary. Test a configuration issue before a live queue is used so the team knows where it is surfaced. The integration should prevent the process from relying on a manual second billing record, but it does not negotiate the contract or choose the revenue-recognition policy.

Inspect these capabilities

Billing lands as deferred revenue. A linked template routes every generated invoice line to the contract's contract liability account instead of the line income account, so recurring billing shows as deferred revenue on the balance sheet, not immediate income, and the recognition run releases it as performance obligations are satisfied.

Mirrors Record Billing exactly. On posting, the invoice registers itself as billing on the contract. If the contract carries a contract asset (revenue recognised ahead of billing), a balanced reclassification clears that asset first, so the ledger shows exactly the split the contract's own Record Billing convention would have produced.

Nothing changes until you link. The link is optional per template. Unlinked templates are untouched and post to income exactly as before, a byte-identical default, so adding the bridge does not disturb any billing already running.

Know the scope boundary

It is a bridge, not a standalone engine: it needs both the Revenue Recognition (IFRS 15) and Recurring Invoices Pro modules, and it relies on their contracts, accounts and recognition run.

A registered recurring invoice has a dedicated manager-only Revenue Billing Correction action. It posts one verified sealed credit note, reconciles the receivable and decrements the exact contract billing anchor; ad-hoc manual credits are not accepted as bridge evidence.

Installation foundation

IFRS 15 Revenue, Recurring Invoices Pro.

ASSETS AND REVENUE

Borrowing Costs (IAS 23)

This module capitalises the borrowing costs directly attributable to the acquisition, construction or production of a qualifying asset under IAS 23. For each period it takes the borrowing costs on funds borrowed specifically for the asset, deducts the income earned on the temporary investment of those funds, and adds the borrowing costs on general borrowings by applying the capitalisation rate to the expenditure on the asset.

20.0.1.0.9 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Record the expenditure timing and financing inputs that define the supported capitalisation calculation.

2. Compute the weighted expenditure base and attributable borrowing cost for the selected period.

3. Review the result against the borrowing evidence and any applicable limitation before posting the balanced capitalisation entry.

4. Retain the project's qualifying-asset assessment and suspension decisions in the close workpapers rather than treating a computed amount as their substitute.

A useful acceptance exercise

A qualifying project incurs expenditure at different points in the period. Record the dated expenditure instead of applying a full-period financing rate to every amount. Review the supported specific and general borrowing inputs and inspect the weighted base used in the capitalisation calculation. Similar total expenditure can have different timing and therefore different attributable cost. Compare the calculated amount with the financing workpaper and the applicable limitations before posting. Include a period in which the project's eligibility or suspension assessment needs a specialist decision. Keep that decision with the calculation: the module can process entered dates and rates, but it cannot establish project facts that were never recorded.

Inspect these capabilities

The whole IAS 23 formula, not a flat rate. The capitalisable amount is specific borrowing cost less temporary investment income, plus general expenditure times the capitalisation rate, then capped at the borrowing costs actually incurred. Investment income floors the specific tranche at zero so it can never subsidise the general pool.

Weighted-average base from dated expenditure. Enter dated expenditure lines and each amount is apportioned by the fraction of the period it was outstanding, giving the weighted-average accumulated expenditure the rate is applied to. Leave the lines blank and a single flat expenditure figure is used instead.

One balanced entry, gated and sealed. Capitalising is restricted to the EH Accounting Manager group and writes a single balanced move that debits the asset account and credits the interest account, marked sealed and stamped on the chatter. Measurement inputs freeze once posted.

Know the scope boundary

It capitalises borrowing costs into a nominated asset account through one general journal entry; it does not integrate with a fixed-asset register or start depreciating the capitalised amount.

It does not pull borrowing costs, expenditure or interest automatically from loans, bank statements or existing journal entries; the specific cost, investment income, expenditure, rate and actual cost are entered on the record.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

ASSETS AND REVENUE

IAS 20 Government Grants

IAS 20 Government Grants records monetary and non-monetary awards with their grantor, agreement reference and source attachments. Deferred-income grants are released manually on explicit earning-period dates; the module does not generate an amortisation schedule.

20.0.1.1.6 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Record the grant and choose the supported deferred-income or asset-deduction treatment that matches the approved accounting policy.

2. Build and review the recognition schedule before running the related period entries.

3. Compare cumulative releases with the grant's recorded amount and inspect any supported repayment or correction workflow.

4. Keep grant eligibility, compliance conditions and supporting correspondence with the responsible project owner; ledger mechanics do not determine eligibility.

A useful acceptance exercise

An entity receives a grant connected with an asset or a defined earning period. Record the accepted grant and the policy choice for its supported presentation. Review the schedule against the related asset or expense pattern before recognising the first period amount. Receiving cash is not automatically the same event as earning all of the income. Inspect cumulative releases and the remaining recorded balance at a later close. Include a supported repayment or correction case if relevant to the grant terms. Keep condition monitoring and eligibility evidence with the funded-project owner, and distinguish compliance with the grant agreement from the accounting schedule that records its approved treatment.

Inspect these capabilities

Income over the earning period, not the grant period. Each amortisation release posts on its own accounting date so grant income lands in the period whose costs it matches (IAS 20.12), not bunched into the period the grant was received.

Deferred income or deduction from asset. An asset-related grant can be shown as deferred income released over time, or recorded by crediting the selected asset account in full on receipt (IAS 20.24 to 27). The module does not create a fixed-asset record or change its depreciation.

Locked figures and manager-only posting. Once a grant is received its amount, accounts and basis freeze, posting actions are limited to the EH Accounting Manager group, entries are sealed, and a grant carrying posted moves cannot be deleted.

Know the scope boundary

It does not create or manage a fixed-asset record. The deduction-from-asset basis credits the selected asset account on receipt; any asset record and depreciation remain outside this module.

It does not build a period-by-period release plan or auto-post releases on a recurring cron; each deferred-income release is entered and posted by the user for its earning period.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

ASSETS AND REVENUE

IAS 2 Inventory NRV

This module runs the IAS 2 measurement rule that inventories are carried at the lower of cost and net realisable value (IAS 2.9). A period-end run holds one line per inventory item or group, each with its cost and its net realisable value, the estimated selling price less the costs to complete and sell (IAS 2.6).

20.0.1.2.2 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Assemble cost and estimated net realisable value for the chosen item or category basis and review the opening allowance source.

2. Compute the closing requirement, gross write-downs, gross reversals and net movement for the reporting date.

3. Resolve an opening mismatch using the authorised evidence path and inspect the proposed movement before posting.

4. Reconcile the allowance to the ledger; the module does not calculate selling estimates or update inventory valuation layers automatically.

A useful acceptance exercise

As an illustrative review case, enter an item with cost of 100 and assessed net realisable value of 80. The required closing write-down is 20 before considering the recorded opening allowance. In a later period, an assessed NRV of 90 implies a requirement of 10. Review the release of the prior allowance as a movement rather than a new positive asset valuation. Compare gross write-down, gross reversal and net movement measures. Review the automatic opening source, or an explicit reasoned manager override where external opening evidence is needed. If grouped-category assessment is chosen, inspect which items may be netted. These entries adjust the allowance; they do not automatically replace stock valuation layers or determine the selling-price estimate.

Inspect these capabilities

Lower of cost and NRV, done properly. Each line records cost and net realisable value; the required write-down is the excess of cost over NRV, floored at zero so it never carries inventory above cost. The run totals the closing write-down and shows the exact movement before you post anything.

Recoveries that cannot overshoot. When NRV recovers, the module reverses the write-down but only up to the amount previously recognised. Because every line floors its write-down at zero, a recovery can release the allowance back toward zero and no further, so the new carrying amount is the lower of cost and...

Posted figures that stay put. Once a run is posted it recognises a balanced, sealed ledger movement. Its date, accounts, journal and inventory lines are frozen against ORM writes, line inserts, moves and deletes.

Know the scope boundary

It does not read stock valuation or quantities from Inventory automatically; you enter cost and net realisable value per line, optionally linking a product for the roll-forward.

It does not calculate net realisable value for you; the estimated selling price less costs to complete and sell is your input.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

ASSETS AND REVENUE

Investment Property

This module records property held to earn rentals or for capital appreciation under IAS 40. On recognition the property is measured at cost, and the entity chooses either the fair value model or the cost model as its policy.

20.0.1.1.8 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Register the property and confirm whether the cost or fair-value model applies under the approved policy.

2. Record acquisition and the supported subsequent measurement actions using the appropriate dated evidence.

3. Review the ledger-linked carrying amount and any transfer or disposal calculation before the manager completes posting.

4. Keep independent valuation, legal ownership and classification evidence with the portfolio file; the module provides the accounting workflow around those inputs.

A useful acceptance exercise

Register a property with its approved accounting model and acquisition evidence. Review the initial accounting and the ledger-linked carrying value before applying subsequent measurement. Under the relevant supported model, inspect a period's depreciation or fair-value movement and retain the valuation basis used by the finance team. Follow a supported transfer or disposal example, comparing dates, proceeds and derecognised amounts to the property history. Assign the classification decision to the appropriate reviewer, especially where actual use of a property changes. The register should explain the accounting treatment, while ownership, independent valuation and business-use evidence remain part of the wider property file.

Inspect these capabilities

Fair value or cost, your policy choice. Pick the fair value model or the cost model per property on the draft record. Fair value properties are remeasured to fair value with the change in profit or loss, cost model properties are depreciated straight line, and the form only shows the fields and buttons that...

Book value follows the posted ledger. Carrying amount and accumulated depreciation are ledger controlled. Once a journal entry exists they are frozen against direct edits, and recognition, remeasurement, depreciation, transfer, and disposal are the only actions that roll them forward, so the book value can never drift away from the posted entries.

It tells you what is missing. A missing property, gain/loss, cash, or accumulated depreciation account, a missing journal, a wrong state, a remeasurement under the cost model, a nil change, or an exhausted depreciable base each surface an explicit message instead of a half posted entry.

Know the scope boundary

It does not manage leases or rental income; it accounts for the property asset itself, not the tenant, lease, or rent invoicing.

Fair value is entered by the user; there is no valuation engine, external appraisal feed, or fair value hierarchy disclosure. Cost-model fair value remains available as the IAS 40.79(e) disclosure measurement.

Installation foundation

Accounting Suite Base, Fixed Assets and Leases, Odoo Accounting, Odoo messaging.

ASSETS AND REVENUE

IFRS 5 Held for Sale

This module implements IFRS 5 for non-current assets, disposal groups and discontinued operations in Odoo 20 Community. When a linked asset is classified, earned depreciation is posted through the exact classification date (including a mid-period stub), its carrying amount is seeded from the resulting ledger net book value, and depreciation is then paused (IFRS 5.25); ceasing classification rebuilds future depreciation prospectively from the resume date.

20.0.2.1.2 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Document the held-for-sale assessment and select the assets and liabilities that belong to the supported disposal group.

2. Compute the lower-of measurement and inspect the related depreciation-stop and classification consequences.

3. Review subsequent changes and the eventual disposal entry, tracing sale proceeds and derecognised balances.

4. Keep the plan-of-sale assessment and discontinued-operation presentation decision with the review evidence; classification requires business judgement.

A useful acceptance exercise

A group plans to sell a qualifying asset or disposal group. Record the classification date and supported membership, then compare the entered carrying amount with fair value less costs to sell. Inspect the lower-of result and the link to any supported depreciation stop. Classification is a decision based on the disposal facts, not merely a convenient way to stop expense. Review a later valuation change and the final disposal path using the same evidence chain. Reconcile the proceeds, balances removed and resulting gain or loss. Keep the assessment of discontinued-operation presentation separate and documented, since a planned sale does not automatically establish that every related amount belongs in that presentation category.

Inspect these capabilities

Lower-of, done right. On classification the item is remeasured to the lower of carrying amount and fair value less costs to sell, and the shortfall posts as a write-down (IFRS 5.15). A stored writedown field always shows the excess.

Depreciation actually stops. Classification sets Depreciation ceased, and when a fixed asset is linked it is paused through its own API so the depreciation cron skips it while held (IFRS 5.25). Cancellation resumes only an asset this record paused itself.

Clean gain or loss on sale. Recording a sale posts proceeds against the carrying amount and books the difference to the gain or loss account, then zeroes the carrying amount. The item can carry a discontinued-operation flag for separate presentation (IFRS 5.33).

Know the scope boundary

It does not automate the twelve-month completion, active-marketing or highly-probable-sale assessment; you decide when an item qualifies for classification and click Classify.

It does not build the face of the statement of comprehensive income or the discontinued-operations note. Its reporting API returns exact-scope pre-tax and explicitly tax-adjusted post-tax values for your reporting layer.

Installation foundation

Accounting Suite Base, Fixed Assets and Leases, Odoo Accounting, Odoo messaging.

GROUP ACCOUNTING

IFRS 3 & IAS 28

This module adds two IFRS mechanics a plain ledger does not carry. On the IFRS 3 side it computes goodwill as consideration transferred (including the acquisition-date fair value of contingent consideration) plus non-controlling interest plus any previously-held interest less the fair value of identifiable net assets acquired, recognises a bargain purchase gain when that arithmetic is negative, and posts a full purchase price allocation that keeps consideration, non-controlling interest and previously-held interest distinct.

20.0.1.2.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Assemble the acquisition-date evidence and enter the supported purchase-price allocation inputs.

2. Review goodwill or bargain-purchase arithmetic and the balanced acquisition posting before authorisation.

3. Track supported measurement-period adjustments, contingent-consideration changes or associate movements with their distinct dates.

4. Keep deal valuation and control or influence assessments with the transaction file; this module records their accounting consequences rather than negotiating the deal.

A useful acceptance exercise

For a supported acquisition, assemble consideration, identifiable net assets and non-controlling-interest inputs as of the acquisition date. Review the goodwill or bargain-purchase arithmetic before accepting the proposed posting. The purchase price is one input into the allocation, not a substitute for the valuation and recognition of the acquired items. Inspect a supported measurement-period adjustment with its distinct information-known and accounting dates. For an associate investment, review the opening cost or adopted entry and subsequent profit, dividend or impairment movement. Preserve the evidence of control or significant influence and the valuation workpaper alongside the accounting register.

Inspect these capabilities

Goodwill that actually adds up. Enter consideration, non-controlling interest, any previously-held interest, and the fair value of net assets, and the goodwill is the standard's arithmetic. A negative result flips automatically to a bargain purchase gain recognised in profit or loss.

The whole allocation in one entry. List identifiable assets and liabilities at fair value on lines and post a single balanced move that debits each asset, credits each liability, raises deferred tax on the step-up, books goodwill, and credits consideration and non-controlling interest.

Associates that roll forward. Carry an associate or joint venture at cost, then pick up your share of profit, record dividends as a reduction not income, impair, and dispose, each as its own balanced entry that updates the carrying amount and the cumulative totals.

Know the scope boundary

It records a single acquirer's acquisition entry and equity-method roll-forward; it is not a full consolidation engine and does not eliminate intra-group balances or produce consolidated statements.

Share of profit, dividends, and impairment are entered per period as amounts you provide; it does not read the investee's own ledger or automate the pick-up.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

GROUP ACCOUNTING

Intercompany SO/PO

Extends the ERP Heritage inter-company engine from invoice and move mirroring to sales and purchase orders, completing the multi-company order cycle.

20.0.1.1.4 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Verify the underlying intercompany configuration and the destination company's product and tax resolution.

2. Confirm the supported source sales or purchase order and inspect the linked draft counterpart.

3. Check quantities, unrounded commercial values, dates and fulfilment information before proceeding with the destination workflow.

4. Use the controlled correction path when paired commercial terms change; the bridge is designed around linked orders and their permitted follow-on actions.

A useful acceptance exercise

Company A confirms an order involving Company B under the configured relationship. Inspect the generated draft counterpart in the destination company before further fulfilment. Compare quantities, products, dates, delivery destination, taxes and unrounded commercial values with the source. Identical visible totals do not prove that destination-company configuration was resolved correctly. Try a permitted follow-on operation and review its link to the paired commercial scope. Where terms must change, follow the supported cancellation and replacement process rather than editing one sealed side independently. Keep sales, procurement and finance aligned on which company owns the next delivery or invoicing action.

Inspect these capabilities

No manual order re-entry. Confirming an order in one company automatically drafts the mirror in the partner company, eliminating duplicate data entry and synchronization delays.

Inspect sealed commercial terms. The receiving company inspects the draft counterpart and accepts it by confirmation. Product, quantity, price and taxes remain sealed to the source; corrections cancel and replace the source transaction.

Order-to-invoice alignment. Extends inter-company automation beyond invoices to include SO and PO, so mirror orders and mirror invoices stay aligned across the trade cycle.

Know the scope boundary

Requires Inter-Company Rules and one enabled destination-company route. A partner with no enabled route confirms normally without a mirror.

Does not auto-confirm mirrored orders. The receiver can inspect and accept the draft, but cannot rewrite its sealed commercial terms independently.

Installation foundation

Inter-Company Rules, Odoo Sales, Odoo Purchase, Odoo dropshipping.

PRESENTATION AND DISCLOSURE

IAS 8 & 10 Events

This module maintains two linked registers. The IAS 8 register records a change in accounting policy, a change in accounting estimate, or the correction of a prior-period error, deriving retrospective versus prospective application from the change type, and building a per-line restatement trail of as previously reported, the adjustment, and the restated amount that totals into the opening retained-earnings impact.

20.0.1.2.10 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Register the accounting change or subsequent event with the dates and classification evidence needed for its supported treatment.

2. Build the retrospective adjustment trail or event assessment, separating estimated effects from matters that cannot yet be quantified.

3. Review the effect on opening equity and the proposed posting date, or document the disclose-only outcome.

4. Keep the authorised financial-statement release date and governance decision with the file; the register does not automatically rebuild every comparative statement.

A useful acceptance exercise

After the reporting date but before the statements are authorised, finance receives new information about a matter. Record both dates and the nature of the evidence before deciding whether the supported event treatment is adjusting or disclose-only. An authorisation cutoff matters: information arriving later needs to be considered against the appropriate reporting period. For an accounting change, compare the previously reported amount, adjustment and restated amount under the supported retrospective path. Distinguish a change in estimate from a prior-period error and inspect any opening-equity posting date. The register preserves the decision trail; it does not automatically regenerate every previously issued report.

Inspect these capabilities

The restatement is a real trail, not a memo field. Each affected line item carries as previously reported, the signed adjustment, and the computed restated amount, and the register totals those adjustments into the opening retained-earnings impact, so the disclosure and the figure that hits equity come from the same lines.

Treatment is derived, and dividends are protected. Adjust-or-disclose is computed from whether the event evidences conditions existing at the reporting date. A dividend declared after year end cannot be marked adjusting, a constraint blocks it, because it is a non-adjusting event that is disclosed, not recognised as a liability.

Posted figures are frozen and only unwound by reversal. Booking is restricted to an EH Accounting Manager. Once posted, the driving fields and lines are locked, deletion is refused, and the only correction path is Reset to Draft, which posts a reversal and reopens the record so nothing drifts away from its ledger entry.

Know the scope boundary

It does not compute the accounting adjustments for you; you enter the affected line items, the as previously reported figures and the signed adjustment, and it totals and posts them.

It does not restate the comparative financial statements or regenerate prior-year reports; it maintains the restatement register and books the opening retained-earnings entry.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

PRESENTATION AND DISCLOSURE

EPS (IAS 33)

This module adds an Earnings Per Share run that computes basic and diluted EPS under IAS 33 with no journal postings, so it is a pure disclosure calculation. Basic EPS is profit attributable to ordinary holders (net profit less after-tax preference dividends) divided by the weighted average number of ordinary shares, and that weighted average is built from dated share movements, each weighted by the number of days it was outstanding within the period.

20.0.1.2.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Define the earnings period and enter share movements with dates that support the weighted-average denominator.

2. Compute basic EPS and review the supported potential-share classes and their incremental dilution.

3. Inspect anti-dilutive exclusions, retrospective factors and continuing-versus-discontinued operation figures where applicable.

4. Retain the sealed calculation as disclosure evidence; this module calculates EPS and does not post a journal entry.

A useful acceptance exercise

An entity's ordinary share balance changes part-way through the reporting period. Enter the dated movements and review the weighted-average denominator instead of dividing profit by the final share count. Add the applicable preference-dividend information and potential ordinary share classes before evaluating the basic and diluted calculations. Inspect the dilution order and exclusion of anti-dilutive instruments, using the continuing-operation control number where relevant. Review any bonus, split or consolidation restatement factor and the supported price observations. Retain the calculation as disclosure evidence; its purpose is to explain earnings per share rather than create a journal entry.

Inspect these capabilities

Weighted average, not a snapshot. The denominator is built from dated share movements on the EPS share movement model, each weighted by the days it was outstanding inside the period rather than taking a single period-end share count. A share issue mid-period contributes only its fraction of the year.

Dilution tested, not assumed. Potential ordinary shares are ordered by incremental EPS and added most-dilutive first, each included only while it keeps reducing EPS. Once an instrument turns anti-dilutive the sequence stops, so a naive add-everything approach that overstates dilution is avoided.

Comparability inputs freeze once computed. After a run reaches the computed state, earnings, period, restatement factor, share movements, and potential-share lines are blocked from edit, append, and delete on both the run and its children. To change a disclosed figure you set the run back to draft and recompute, leaving an audit...

Know the scope boundary

EPS remains a disclosure computation and posts no journal entries.

Net profit, preference dividends, and ordinary-share balances are entered or integrated explicitly; the engine never guesses a cap table.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

FINANCIAL INSTRUMENTS AND RISK

IFRS 2 Share-based Pay

A dedicated IFRS 2 share-based payment engine for Odoo 20 Community. Plans define the settlement mode, vesting terms and condition kind; grants under a plan carry the instruments, the grant-date fair value and an updatable forfeiture estimate.

20.0.1.0.12 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Record the award's settlement mode and condition type, reviewing grant-date information and any graded vesting structure.

2. Compute the period run using the supported equity-settled or cash-settled treatment and inspect cumulative versus period expense.

3. Review modifications, cancellations and forfeiture changes with the appropriate evidence before posting the sealed period entry.

4. Keep valuation assumptions and plan documentation with the workpaper; built-in pricing helpers still depend on the inputs and model suitability chosen by the reviewer.

A useful acceptance exercise

Enter a plan with its approved settlement type, condition kind and vesting terms. For an equity-settled award, review the grant-date valuation and the instruments expected to vest; for a cash-settled award, inspect the current valuation input and period liability. A shared number of instruments does not make their subsequent accounting identical. Include a graded-vesting or supported modification example and inspect the period delta against cumulative expense. Review the treatment of a failed market condition separately from a supported non-market forfeiture. Keep the plan agreement, valuation inputs and approval of estimates with the period run so the ledger movement can be explained.

Inspect these capabilities

Grant-date value, trued up right. Equity-settled awards accrue grant-date fair value times the instruments expected to vest times the vested fraction. The expected count is the granted number net of the current forfeiture estimate, and each period run trues it up through the current-period charge.

Each tranche on its own clock. Graded plans carry tranche lines that each vest on their own date and are expensed over their own period off their own fair value, per IFRS 2.IG11. Tranche portions must sum to 100 percent, checked on activation, so no instrument is expensed twice or dropped.

A liability that remeasures. Cash-settled awards carry a liability remeasured to the current fair value at each period end until settlement, and the settlement action trues the liability to the amount paid through expense before it pays out, per IFRS 2.30-33.

Know the scope boundary

It provides the IFRS 2.45 instrument rollforward and supporting exercise-price and contractual-life measures, but not a fully formatted financial-statement note or the narrative fair-value assumption tables.

Service expense is prorated through the current anniversary month; it is an accounting-period measurement, not a payroll-style daily entitlement engine.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

FINANCIAL INSTRUMENTS AND RISK

IAS 19 Benefits

An IAS 19 accounting layer for defined benefit valuations and defined contribution accruals. Actuarial results are imported inputs; the module has no actuarial engine.

20.0.1.0.7 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Create the plan and account configuration, then enter the external actuarial figures and opening balances for the reporting period.

2. Review the obligation and plan-asset rollforwards, recognised net position, asset ceiling and allocation between profit or loss and OCI.

3. Post the supported valuation or defined-contribution accrual and inspect its linked entry and disclosure output.

4. Retain the actuary's report with the source evidence; the module contains accounting mechanics rather than an actuarial valuation engine.

A useful acceptance exercise

The actuary supplies period-end obligation and plan-asset figures with service cost, interest and remeasurement information. Enter those inputs against the plan's approved opening position and accounts. Review the rollforwards, asset ceiling and recognised net position before accepting the separation between profit or loss and non-recycling OCI. Compare the proposed entry and rendered disclosure with the external valuation workpaper. Include a defined-contribution accrual example where that separate supported process is needed. The accounting module does not calculate actuarial assumptions or the defined-benefit obligation from employee demographics; those supplied results remain the responsibility of the external valuation process.

Inspect these capabilities

P&L and OCI, kept apart. Current and past service cost and net interest go to profit or loss; actuarial gains and losses, the excess return on plan assets and asset ceiling changes go to other comprehensive income and are never recycled (IAS 19.122). Each posted valuation books one balanced entry that splits...

Closing figures that must tie. The closing obligation and closing plan assets are editable so the actuary's reported figures can be keyed, but a rollforward-tie constraint refuses any closing that does not reconcile to the movement analysis within a cent, and each period's opening chains to the prior posted valuation's closing.

Surplus capped at the ceiling. When the plan is in surplus, the recognised asset is the lesser of the surplus and the asset ceiling (IAS 19.64); the unrecognisable excess is an allowance credited to the plan asset account, and its period change routes to OCI, disclosed separately in the ceiling schedule.

Know the scope boundary

It is an accounting layer, not an actuarial engine: the obligation, plan assets, service cost, actuarial gains and losses and asset ceiling are imported inputs. It carries no mortality tables and no salary projection.

Net interest is the discount rate on the opening balances (IAS 19.123 simplified); mid-year weighting of contributions and benefit payments in the interest calculation is out of scope.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

PLANNING AND ANALYSIS

Standard Costing & CVP

A management accounting layer for Odoo 20 Community. Standard cost cards hold the per-unit standard quantity and price of each cost element (material, labour, variable overhead, fixed overhead) for a product or free-form item, with one active card per product enforced.

20.0.1.0.7 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Agree the standard cost elements and units before entering the period's actual input quantities and costs.

2. Compute the variance run and inspect the full decomposition and its reconciliation to total actual cost less absorbed standard cost.

3. Use contribution and CVP calculations to evaluate the entered price, volume and cost assumptions, keeping analysis separate from optional posting.

4. Make the business owner responsible for assumptions and data collection; the module is not an automatic replacement for stock valuation or production capture.

A useful acceptance exercise

A product's standard card includes material, labour and overhead inputs. Enter the actual production and input quantities and costs for the period, then inspect the variance decomposition. A higher material spend may reflect a rate difference, a usage difference or both; management needs that distinction rather than one unexplained total. Reconcile the complete variance set to actual cost less standard cost absorbed. Review contribution, break-even and target-profit calculations against the entered revenue and cost assumptions. Begin in analysis-only mode and treat optional variance posting as a separate decision with configured accounts. The exercise does not automatically change product costs or stock valuation.

Inspect these capabilities

Eight variances, one identity. The variance run splits the total cost variance into material price and usage, labour rate and efficiency, variable overhead spend and efficiency, and fixed overhead spend and volume. Because each element's two variances telescope, the eight lines always sum exactly to total actual cost minus total standard...

Analysis-only by default. Posting is off by default. In analysis-only mode nothing touches the general ledger, so the module fits any inventory setup.

Contribution margin and CVP. The contribution report reads the standard variable cost off the card, takes revenue manually or from posted invoice lines, and derives break-even units and revenue, target-profit units, margin of safety and the degree of operating leverage in one documented pass.

Know the scope boundary

It does not integrate with stock moves or post standard-cost valuation layers; the input side is deliberately ledger-independent and inventory valuation integration is a documented later wave.

It does not build a multi-input bill per element; each element carries a single standard quantity and price, so a mixed material or labour class is one blended line.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging, Odoo Products.

PRESENTATION AND DISCLOSURE

IAS 1 Primary Statements

This module adds the IAS 1 statement of changes in equity and statement of comprehensive income, with one authoritative statement per company and period. SoCI includes the IAS 1.82 profit-or-loss line items, related tax for every OCI component, associates and joint ventures OCI, reclassification sections, owners/NCI attribution and annual or IAS 34 interim comparatives.

20.0.1.3.0 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Confirm structural account settings and choose the authoritative company and reporting period for each statement.

2. Prepare the statement of comprehensive income and changes in equity using the supported presentation and comparative options.

3. Inspect the cross-statement tie-out, tax and reclassification treatment before signing the statement records.

4. Preserve the signed statements with their source ledger and any consolidation provenance; a complete reporting pack may need the separate report and notes modules.

A useful acceptance exercise

The reporting team prepares comprehensive income and changes in equity for the same company and period. Review structural account settings, OCI components, related tax and owner or non-controlling-interest attribution before judging the totals. An account name that resembles an OCI category is not an adequate substitute for explicit configuration. Inspect the cross-statement comparison with the posted ledger and investigate an unexplained difference before sign-off. Review a comparative or interim presentation if used by the entity. Preserve signed statement records and consolidation provenance where applicable, and combine them with the other reports and notes required for the complete financial-statement pack.

Inspect these capabilities

Figures you can defend, not retype. Derive opening equity, per-component opening balances and profit for the period straight from posted journal items, then read the closing tie-out that shows whether the worksheet actually agrees with the general ledger at period end.

Both primary statements, done properly. The equity statement rolls each component from opening to closing across profit, OCI, dividends, share issues and other movements; the comprehensive income statement groups OCI by whether it may be reclassified to profit or loss and attributes total comprehensive income to owners and non-controlling interests.

A confirmed statement stays put. Once an EH Accounting Manager confirms a statement its figures and lines are frozen, so a raw write, a new line or a deletion cannot silently move the totals. Reopening to edit is a manager-gated action that unlocks the figures again.

Know the scope boundary

It posts no journal entries; both statements are disclosure worksheets that derive from and reconcile to the ledger, they do not change it.

It does not render a formatted PDF or spreadsheet statement; it presents the figures and tie-outs on Odoo form and list views.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

PRESENTATION AND DISCLOSURE

IFRS Disclosure Notes

Financial Statement Disclosures maintains seven disclosure registers that a plain ledger does not produce, and generates their numbers instead of asking for them. A related-party register (IAS 24) records relationships, transactions and outstanding balances, ties the outstanding balance back to the linked contact's posted receivable and payable lines, and carries the IAS 24.17 key-management compensation categories with the share-based figure prefilled from the IFRS 2 engine when installed.

20.0.1.2.3 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Choose the relevant disclosure register and establish the relationships, accounts or analytic dimensions it needs.

2. Generate or enter the supported note figures and inspect any feeds available from separately installed accounting engines.

3. Review reconciliations, threshold tests, manual overrides and finalisation controls before signing the note record.

4. Keep narrative policy and entity-specific disclosures under the reporting team's review; seven governed registers do not constitute every possible financial-statement note.

A useful acceptance exercise

Select a relevant disclosure register, such as related parties, segments or financial-instrument risk. Define its relationships, account scope or analytic dimensions before generating the supported figures. Compare material balances with the ledger evidence and identify any manually overridden amount that needs a reviewer's explanation. For a note fed from another installed engine, trace a figure to the accepted source run. For segment work, inspect the relevant threshold and reconciliation; for maturity work, distinguish undiscounted cash-flow assumptions from carrying balances. Finalise only the reviewed record, keeping entity-specific narrative and policy disclosures with the reporting team.

Inspect these capabilities

Notes that tie back to the ledger. Related-party balances tie to the contact's posted receivable and payable lines, financial-risk carrying amounts tie to named accounts, and segment revenue and result derive from analytic-tagged postings, so a hand-keyed figure that drifts from the general ledger becomes visible instead of hiding in a spreadsheet.

Real IFRS mechanics, not narrative fields. Segments are tested against the IFRS 8.13 ten-percent revenue, profit-or-loss and asset thresholds; credit exposures are staged under the IFRS 9 twelve-month and lifetime ECL model that feeds the IFRS 7.35H net carrying amount; the maturity analysis projects undiscounted contractual cash flows including coupons per IFRS 7.B11D.

Finalise, freeze and lock. Every register can be finalised by an EH Accounting Manager, which freezes its input figures, blocks edits and deletes, and even refuses appended child rows so a signed-off disclosure cannot be silently re-keyed. Computed tie-out and reconciliation figures still recompute, and only a manager can reopen.

Know the scope boundary

It posts no journal entries and creates no accounting moves; the registers are disclosure records that read from the ledger, they do not write to it.

The ledger tie-outs are advisory. A drift between an entered figure and the derived ledger figure is flagged but never blocks saving or finalising a register.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

PLANNING AND ANALYSIS

Reports: Budget Columns

Extends the by-nature, single-company Profit and Loss report with Budget, Actual-minus-Budget Variance, and Variance Percent columns. Company-wide budgets compare to company actuals.

20.0.1.0.7 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Select the eligible budget in the supported single-company, by-nature Profit and Loss report.

2. Choose daily-overlap apportionment or exact-period validation and inspect the resulting budget, variance and percentage columns.

3. Review company-wide or allocation-weighted actuals against the budget scope so the comparison has a consistent denominator.

4. Keep the bridge focused on the supported report layout; budget preparation and version approval remain in the separate budget module.

A useful acceptance exercise

A company selects an annual budget while reviewing a quarter's by-nature P&L. Under daily-overlap apportionment, inspect the disclosed allocation of the budget across the selected dates; under exact-period validation, use aligned periods or review the rejection of a mismatched choice. The policy decision changes the meaning of the comparison and should be visible to management. Review an account present only in the budget and check how it contributes to its section total. For an analytic-scoped budget, compare allocation-weighted actuals within the same scope. Inspect a zero-budget line without treating its percentage result as an ordinary finite growth rate. Unsupported dimensions should prompt a scope correction rather than a misleading total.

Inspect these capabilities

Selection-based activation. Budget columns appear only when you choose a budget in the report's Budget option. Without selection, the P&L displays normally.

Type-based section reconciliation. Income and expense section budgets are derived from account types, not summed from arbitrary budget lines. This keeps budget section totals consistent with their underlying account budgets.

Requires budget module. Depends on Multi Version Budget Pro to provide the budget records and budget line data. Cannot function standalone.

Know the scope boundary

Requires Multi Version Budget Pro.

Supports one report company, one coherent company-wide or analytic scope, and by-nature P&L.

Installation foundation

Dynamic Account Reports, Multi Version Budget Pro.

CLOSE AND ASSURANCE

Audit Pack & Integrity

Audit Pack and Integrity hardens the period close so an auditor can trust the ledger. It switches Odoo's inalterable hash chain (restrict mode) on the company's sale, purchase, general, bank and cash journals, then scans the period for four integrity controls: no draft entries, every posted entry balanced to zero, every posted entry on a hash-restricted journal carrying its hash, and no open bank or cash suspense.

20.0.1.0.4 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Review the journal protection policy and the period scope before enabling controls with durable accounting consequences.

2. Run the integrity scan and resolve draft entries, balance exceptions, missing hash evidence or open suspense identified by the controls.

3. Have an eligible manager other than the preparer review the current result and perform sign-off only when the period has ended.

4. Treat advanced fiscal and hard lock dates as an accounting governance decision; a successful scan does not replace external audit procedures.

A useful acceptance exercise

A period has ended, but its scan finds a draft entry and an unresolved bank suspense balance. Assign and resolve those matters through the normal accounting workflows before presenting the period for sign-off. Review journal hash protection and balanced posted entries alongside the other supported checks. A previously green scan should not be treated as permanent evidence after the ledger changes. Ask an eligible manager other than the preparer to review the live result. Before completing sign-off, confirm the consequences for fiscal and hard lock dates and the organisation's correction policy. Retain the signed pack as evidence of these system controls while maintaining the other reconciliation and external audit procedures required for the financial statements.

Inspect these capabilities

The hash chain, actually re-verified. Sign-off does not just check that a move carries some hash; it re-derives the inalterable chain through core's per-prefix integrity check and blocks if any link fails to recompute. A move whose stored hash or a hashed field was edited underneath a stale hash is caught, not...

The preparer cannot sign their own work. The user who runs the checks is stamped as preparer of record on the first run and is never overwritten. Sign-off is refused if that same user attempts it, and both the preparer and signer identities are anchored so a direct RPC write cannot reassign or clear...

The gate is recomputed at sign-off. Checks are rescanned against the live ledger at the moment of sign-off, so a period that has since gained a draft, unbalanced, or unhashed entry cannot be signed off on a stale stored result. An unmet blocking check, a self-sign-off, or an already-signed period each raise an...

Know the scope boundary

It does not generate a PDF or exportable audit report; the pack and its check rows live in the Odoo UI with chatter history.

It does not detect fraud or judge whether individual transactions are correct; it verifies structural integrity (drafts, balancing, hashing, suspense) and enforces sign-off.

Installation foundation

Accounting Suite Base, Odoo Accounting, Odoo messaging.

ELECTRONIC DOCUMENTS AND COMPLIANCE

EH EDI Core

Internal technical dependency for the ERP Heritage e-invoicing modules (Mauritius MRA, France PDP / PPF Factur-X, Peppol BIS Billing). It gives the e-invoicing line two shared foundations so each format module stays small, consistent, and audited in one place.

20.0.1.2.1 / LGPL-3 / GLOBAL SUITE MEMBER

Start with the intended workflow

1. Identify the consuming e-invoicing addon and prepare the documented key source and namespace before storing credentials.

2. Map a representative invoice to the canonical structure and check the financial and party semantics used by the downstream format.

3. Exercise supported credential reading and rotation in a safe environment, retaining the required historic key configuration for existing ciphertext.

4. Keep keys, backups and rotation ownership in the deployment runbook; this dependency is infrastructure and does not itself provide an access point or tax submission service.

A useful acceptance exercise

An integration administrator prepares the key source used by a consuming e-invoicing module. Confirm the supported namespace and key configuration before storing credentials, and retain the historic keys needed to read existing versioned ciphertext. Key rotation is an operational process with backup and ownership requirements, not a reason to expose secrets in user-visible records. Separately map a representative invoice and review its canonical parties, taxes and totals before the consuming format serialises it. Include a relevant rounding, prepayment or currency case in the downstream document test. The core provides shared semantics and credential services; the actual document format, validator and network transport remain responsibilities of the consuming modules.

Inspect these capabilities

Crypto and common mapping, written once. Credential encryption and common EN 16931 financial semantics live in one audited dependency. Participating format modules reuse them and add only their jurisdiction or transport evidence.

Authenticated encryption with key identity. AES-256-GCM ciphertext carries a format version and key id. Historic keyrings preserve existing data while controlled rotation re-encrypts it under the current key.

One financial model, format-specific evidence. Shared adapters carry legal parties, net prices, stable unit codes, booked taxes, totals, and references. Peppol and Factur-X consumers retain their own profile identifiers and serialization rules.

Know the scope boundary

This is a technical dependency, not an end-user application. It has no user interface, no menu, and no configuration of its own, and is installed automatically with the e-invoicing modules that need it.

EH EDI Core emits no XML itself. The CII input adapter and UBL input adapter adapters build the input the serializers consume; the actual CII and UBL serialization lives in the consuming format modules (France CII, Peppol UBL).

Installation foundation

Odoo base.

ELECTRONIC DOCUMENTS AND COMPLIANCE

AU BAS Reporting

Australian BAS is an optional country app built on the ERP Heritage accounting suite. Installing this app installs the global suite and adds the Australian reporting workflow.

20.0.1.2.2 / LGPL-3 / OPTIONAL AUSTRALIAN APP

Start with the intended workflow

1. Check tax-grid mapping, company details and the cash or accrual basis before preparing the period figures.

2. Compute and review the supported label values, entering only the adjustments and manual inputs appropriate to the reporting scope.

3. Inspect the original or amendment relationship and retain confirmation from your external ATO filing process before marking the BAS run lodged.

4. This app prepares quarterly BAS figures and records lodgement evidence.

A useful acceptance exercise

An Australian company prepares a quarter's BAS figures and later identifies information requiring an amendment. Confirm the tax-grid mapping, period and cash or accrual basis for the original calculation. Separate automatically computed labels from manually entered worksheet amounts and reconcile the GST control information to the recorded figures. Review the original-versus-amendment relationship and the retained snapshot rather than overwriting the history of what was submitted. Use the external ATO filing process to submit the approved figures; this module does not provide SBR transmission. Mark the BAS run as lodged after the external filing is confirmed. Keep approval with the responsible tax reviewer and confirm that the required agency and external-service arrangements exist outside the worksheet alone.

Inspect these capabilities

Originals and amendments. One original plus a strictly ordered chain of amendments is enforced per company and fiscal quarter.

AU-grid calculation. G1, 1A and 1B preserve authoritative signed AU tax-grid tags for invoices and refunds; G1 also includes posted genuinely untaxed customer revenue without inventing GST.

Immutable lodgement snapshot. Label definition, amount, company currency, actor, time, and tax-lock evidence freeze when lodged.

Know the scope boundary

This is the optional Australian reporting app. It depends on the full accounting suite; the suite does not depend on BAS.

This app prepares quarterly BAS figures and records lodgement evidence. Filing with the ATO uses your external process; SBR transmission is not included.

Installation foundation

Odoo 20 Community Accounting Pro, Accounting Suite Base, Dynamic Account Reports, Odoo Accounting, Australian localisation.

REPORT ACCEPTANCE

One account tree. One balance.

Use Odoo 20 Parent Account relationships directly. Trial Balance, Profit and Loss, and Balance Sheet offer Account hierarchy and Flat accounts.

Choose the layout, retain the scope

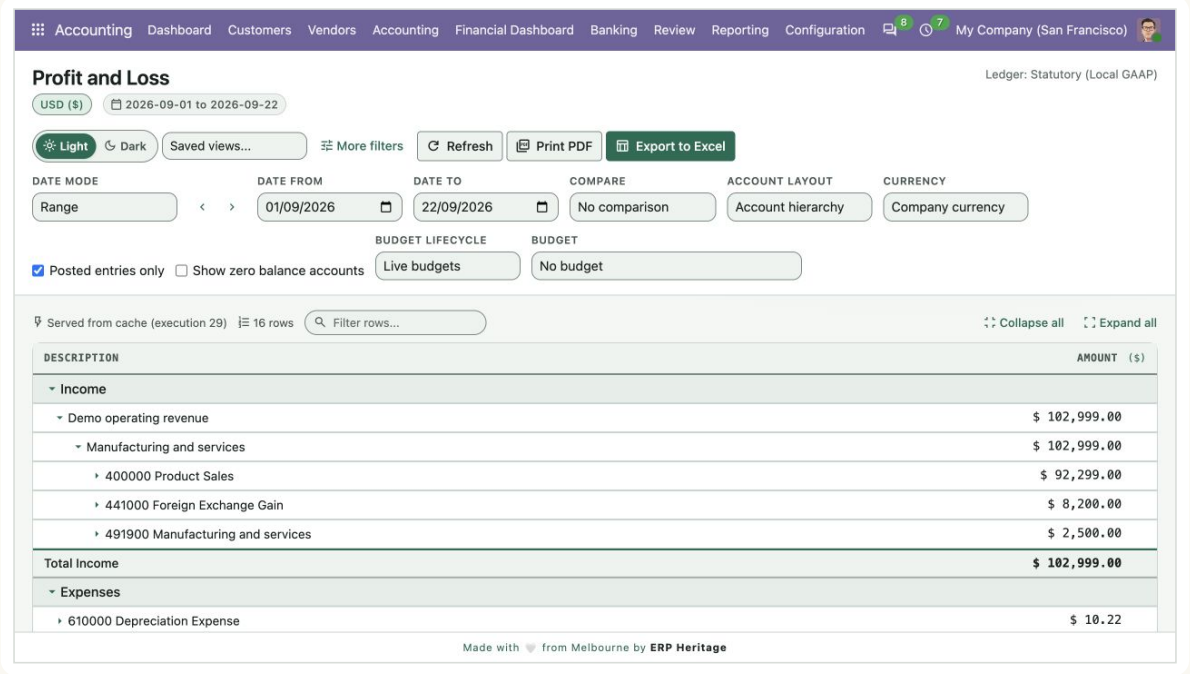

Account hierarchy shows native ancestors and their rollups. Flat accounts shows posting accounts without grouping rows. Company, dates, currency, ledger, comparisons and budget keep their own meanings. Save the view to retain the layout choice; scheduled exports use the saved options.

Read a parent with its own postings

A parent subtotal includes its own posting plus descendants exactly once. The parent posting is shown separately below its group so users can trace the subtotal. An archived grouping account remains visible when it contains relevant history. A zero-net group remains visible when nonzero children offset.

Three-level synthetic example

The captured tree contains Demo operating revenue, Manufacturing and services, and Product Sales. Manufacturing and services is archived and carries its own 2,500 posting. Income totals 102,999: Product Sales 92,299, Foreign Exchange Gain 8,200, and the parent own posting 2,500. Do not add a displayed parent subtotal to its children again.

Account hierarchy shows three native account levels, an archived grouping parent, and its own 2,500 posting included exactly once in the 102,999 income total. Captured 2026-09-22 from an isolated Odoo 20 Community database with synthetic records. Hierarchy and flat layouts use identical company, statutory ledger and September date scope. No live service or external submission is represented.

Scope boundary: General Ledger retains account-to-transaction grouping; Custom Report Builder retains authored row hierarchies. Partner, tax, analytic and cash-flow groupings are not relabelled as native account trees. See the per-report support matrix in docs/accounting20/parent-account-support.md.

BANK-FEED ACCEPTANCE

Import. Review. Reconcile.

The selected operating chain uses the existing optional Plaid adapter and native Odoo accounting entries. Provider HTTP is mocked in the acceptance pack; live deployment acceptance remains separate.

1 / Complete the provider update

Gather the full cursor update before saving booked statement rows, durable progress and change evidence. A failed page or accounting operation must leave the previous cursor available for a complete retry. Pending transactions are excluded from new accounting rows.

2 / Preserve changed-source evidence

Modified or removed provider transactions do not silently rewrite posted or reconciled accounting. Inspect Bank Feed Changes, trace the original record and perform any required correction through normal accounting controls. Acknowledging the review records notes and reviewer; it is not an accounting reversal.

3 / Let automatic matching earn confidence

An automatic rule must still satisfy ambiguity checks and the default exact-amount requirement. Tied candidates and partial amounts require review rather than an arbitrary match. Company, currency and access scope remain enforced. Provider counterparty text stays visible to help the reviewer.

4 / Commit accounting and audit together

A match or fee write-off, its audit evidence and session counters share one transaction boundary. A late failure rolls all of them back. A foreign-currency fee compares and converts amounts in the correct currency rather than mixing the bank amount with a company-currency residual.

5 / Trace settlement and recovery

Inspect the statement, the outstanding receipt or payment, the reconciled accounting lines and their report effect. Repeating a provider update must not create duplicate source rows. Test undo and re-review with the retained accounting and provider history.

6 / Complete the live handover

Use the intended institution, consent and commercial arrangement for a separate live acceptance run. Confirm credentials, renewal, provider errors, pagination, backdated items and recovery with the responsible team. The automated pack does not initiate or sign bank payments and does not submit tax returns.

CLOSE READINESS

Use the handbook as a review aid

A completed system workflow supports the accounting process. The responsible team still owns its assumptions, source evidence and professional conclusions.

Daily balances

Can the team explain cash, unsettled receivables and payables, statement-import exceptions and unresolved reconciliation items? Assign owners to open matters before relying on the reporting pack.

Specialist movements

For each applicable register, does the opening balance tie, are current inputs supported, and can the reviewer trace the period movement to the accepted journal or disclosure? Preserve contracts, valuations, tax and actuarial evidence where the process needs them.

Reporting consistency

Do company, dates, currency, native ledger and analytic scope match the question? Reports default to statutory journals; select All ledgers or Selected adjustment ledgers deliberately and retain that choice with exports. Distinguish historical actuals, budget baselines, projections and current open-item views. Reconcile material statement and disclosure amounts with their source records.

Review and locking

Have the required independent reviewers completed their work? Resolve integrity findings before sign-off and confirm the consequences of fiscal and hard locks. Retain the correction policy with the close evidence.

Source and illustration notes

This handbook was compiled from the owned ERP Heritage module manifests, local model field guidance, editorial corpus and the suite navigation documentation. Screens were captured on an isolated Odoo 20 Community database with synthetic records. Scenarios are illustrative operating exercises, not customer testimonials or performance benchmarks.

Scope of this edition

The global suite has 50 direct accounting dependencies and 52 custom modules in its closure, including the suite and EH EDI Core. This handbook includes 53 module quickstarts because Australian BAS is covered as a separately selected optional app. External adapters, service subscriptions and professional assessments remain subject to their documented requirements.

Support and further detail

Use each module's Apps listing for the full feature, workflow and scope reference. ERP Heritage: www.erpheritage.com.au. Support: info@erpheritage.com.au. When reporting an issue, identify the module, Odoo version, company context and a reproducible example without including passwords or live credentials.
